|                  |                                              |
|------------------|----------------------------------------------|
| <b>AMH</b>       | Affordable Multifamily Housing               |
| <b>ARs</b>       | Adjustment Ratios                            |
| <b>ARet</b>      | Appliance Retirement                         |
| <b>ASFH</b>      | Affordable Single-family Homes               |
| <b>BER</b>       | Business Energy Rebates                      |
| <b>BNI</b>       | Business, non-profit and institutional       |
| <b>CASHP</b>     | Central air-source heat pump                 |
| <b>CGH Grant</b> | Canada Greener Homes Grant                   |
| <b>DAs</b>       | Delivery Agents                              |
| <b>DHW</b>       | Domestic hot water                           |
| <b>DIY</b>       | Do-it-yourself                               |
| <b>DR</b>        | Demand Response                              |
| <b>DSM</b>       | Demand-side management                       |
| <b>E1</b>        | EfficiencyOne                                |
| <b>EAs</b>       | energy auditors                              |
| <b>ENS</b>       | Efficiency Nova Scotia                       |
| <b>EPI</b>       | Efficient Product Installation               |
| <b>EUL</b>       | Effective useful life                        |
| <b>GHG</b>       | Greenhouse gas                               |
| <b>HEA</b>       | Home Energy Assessment                       |
| <b>HRM</b>       | Halifax Regional Municipality                |
| <b>LED</b>       | Light-emitting diode                         |
| <b>M&amp;V</b>   | Measurement and verification                 |
| <b>MA</b>        | Measure Assessment                           |
| <b>MSHP</b>      | Mini-split heat pump                         |
| <b>MURB</b>      | Multi-Unit Residential Buildings             |
| <b>NECB</b>      | National Energy Code of Canada for Buildings |
| <b>NS Power</b>  | Nova Scotia Power                            |
| <b>NSUARB</b>    | Nova Scotia Utility and Review Board         |
| <b>NTGR</b>      | Net-to-gross ratio                           |
| <b>OLPA</b>      | Oil to Heat Pump Program                     |
| <b>SBES</b>      | Small Business Energy Solutions              |
| <b>SEM</b>       | Strategic Energy Management                  |

## DEFINITIONS

|                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Accuracy</b>                           | Reflects the proximity of measurements to the true value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Adjustment ratio</b>                   | The ratio of evaluated results to tracked results. This ratio expresses the adjustment made to tracked savings or other tracked values such as effective useful life.                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Available Demand Response Capacity</b> | The capacity which is available to NSP to reduce system peak demand. This capacity is calculated based on the first two hours of all events called between December and February, excluding weekends and holidays. If an event is shorter than two hours, only the first hour is used to measure the available DR capacity. Available DR capacity is evaluated on a per-participant basis, based on the average demand reduction observed for each event that the participant was scheduled to participate in. E1's total available DR capacity is the sum of each participant's available DR capacity. |
| <b>Baseline</b>                           | To determine gross savings, a baseline (or base case) is established providing detailed information about the reference (e.g. pre-existing or standard) measure or equipment chosen to be compared with the efficient measure or equipment. For the reference measure or equipment, the baseline may include such information as the hours of operation, wattage, and base consumption.                                                                                                                                                                                                                 |
| <b>Bias</b>                               | Systematic deviations of measurements from the true value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Billing calibration</b>                | An activity that consists of adjusting the expected energy savings based on the relative difference between the results of energy simulations and the actual energy consumption of a building or system.                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Confidence interval</b>                | The estimated range of values that is likely to include unknown population parameters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Demand response</b>                    | Demand response measures generate savings in the form of available capacity or load reduction in response to events called by the electric utility (Nova Scotia Power) to reduce the load at strategic moments. These events can be called at any time and for any duration, although they are usually called for one to four hours during peak periods.                                                                                                                                                                                                                                                |
| <b>Displaced wattage</b>                  | The displaced wattage is defined as the difference between the wattage values of the baseline equipment or product and the efficient equipment or product.                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>EnerGuide rating</b>                   | An EnerGuide (official brand of Natural Resources Canada) rating is a standard measure of home energy performance. It is a measure of the efficiency of the building only and does not take into account occupant behaviour. It shows how energy efficient a home is through modelled home heat losses based on several factors including building envelope characteristics, heated volume, heating systems, and air leakage.                                                                                                                                                                           |
| <b>Effective useful life</b>              | The period a measure is expected to be in service and provide both energy and peak demand savings. This value combines equipment life and measure persistence, which includes factors such as business turnover or early retirement.                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Equipment life</b>                     | The number of years installed equipment will operate before it fails.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

|                                         |                                                                                                                                                                                                                                                                                                                      |
|-----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Equivalent CO2</b>                   | A unit of measurement indicating the amount of carbon dioxide to which various kinds of emitted greenhouse gases are equivalent in terms of warming effects. In this report, gas global-warming potential is estimated over a timescale of 100 years.                                                                |
| <b>Equivalent effective useful life</b> | The number of years by which the first-year savings estimate is multiplied to obtain lifetime energy savings. This value takes into account variations in annual energy savings throughout the effective useful life due to increased baselines.                                                                     |
| <b>Evaluated savings</b>                | Gross and net energy or peak demand savings calculated by the Evaluator using the parameters (unitary savings values, installation rates, interactive effects, net-to-gross ratios, etc.) validated or measured during the evaluation process. Unless otherwise specified, evaluated savings are first-year savings. |
| <b>Evaluation plan</b>                  | The evaluation plan summarizes the program description, objectives, base cases, documentation, evaluation methodology, budget, and schedule.                                                                                                                                                                         |
| <b>First-year savings</b>               | The first full year of energy or peak demand savings generated by an energy efficiency measure.                                                                                                                                                                                                                      |
| <b>Free-ridership</b>                   | Percentage of gross savings attributable to participants who would have implemented the same or similar energy efficiency measures, with no change in timing, in the absence of the program.                                                                                                                         |
| <b>Gross savings</b>                    | Change in energy consumption and/or demand that results directly from program-related actions taken by participants in an efficiency program regardless of why they participated.                                                                                                                                    |
| <b>Induced consumption</b>              | Energy consumption of appliances that would have been unplugged and not replaced by participants in the absence of the program.                                                                                                                                                                                      |
| <b>Interactive effects</b>              | Effects on the energy consumption of other systems in a building (such as heating and cooling) due to the installation of an energy-efficient measure.                                                                                                                                                               |
| <b>In-service rate</b>                  | The proportion of incentivized products that are installed and operating. This rate is usually applied to programs through which rebates are offered in-store and products are likely to be stored for a certain period before being installed, such as LED lamps.                                                   |
| <b>Installation rate</b>                | The proportion of incentivized products reported as installed and that remain installed and operating at the time of evaluation. This rate is usually applied to direct install or mail-in rebate programs through which measures are expected to be installed immediately at the time of participation.             |
| <b>Lifetime energy savings</b>          | The energy savings that occur over the lifetime of an energy efficiency measure. Lifetime energy savings account for a measure's effective useful life and any increase in the baseline efficiency level (which reduces attributable annual savings) over its lifetime.                                              |
| <b>Line loss factor</b>                 | The multiplier to convert savings at the customer meter to savings at the utility generator. It accounts for the electrical losses of the transmission and distribution system.                                                                                                                                      |
| <b>Margin of error</b>                  | The amount of random sampling error.                                                                                                                                                                                                                                                                                 |
| <b>Market effects</b>                   | The impact of a program on the market (in terms of increased product availability, practices, and prices) that extends beyond changing program participant behaviours. This includes spillover among non-participants.                                                                                               |

|                                 |                                                                                                                                                                                                                                                                                                                                              |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Net savings</b>              | Energy or peak demand savings that can be reliably attributed to a program. This includes effects such as free-ridership and spillover that negatively or positively affect the savings attributable to a program.                                                                                                                           |
| <b>Net-to-gross ratio</b>       | The ratio of net energy savings to gross energy savings.                                                                                                                                                                                                                                                                                     |
| <b>Non-sampling error</b>       | Errors arising during all survey activities other than sampling. Non-sampling errors tend to lead to bias in measurements and are very difficult to quantify.                                                                                                                                                                                |
| <b>Peak coincidence factor</b>  | The percentage of measure demand savings that coincide in time with the annual peak demand of the entire electricity system.                                                                                                                                                                                                                 |
| <b>Peak demand savings</b>      | The demand savings that coincide in time with the expected annual peak demand period of the entire electricity system. For industrial participants on an interruptible rate, peak demand savings may include savings on non-firm loads, i.e. loads that may be interrupted when Nova Scotia Power's 10-minute reserve is low.                |
| <b>Precision</b>                | The extent to which repeated measurements agree with one another.                                                                                                                                                                                                                                                                            |
| <b>Random sampling error</b>    | An error in measurement because measurements are taken from a subset of the population and not the entire population.                                                                                                                                                                                                                        |
| <b>Realization rate</b>         | The ratio of evaluated savings to tracked savings.                                                                                                                                                                                                                                                                                           |
| <b>Sample size</b>              | The number of observations or replicates included in a statistical sample.                                                                                                                                                                                                                                                                   |
| <b>Secondary market impacts</b> | Energy consumption of appliances that would have been transferred to the secondary market if said appliances had not been retired.                                                                                                                                                                                                           |
| <b>Spillover</b>                | Savings attributable to participants who implement the energy efficiency measure(s) introduced by a program after participating in it once, without participating in the program a second time.                                                                                                                                              |
| <b>Tracked savings</b>          | Gross and net savings calculated based on various parameters such as number of participants or units installed or sold, unitary savings values, installation rates, interactive effects, and net-to-gross ratios. Those parameters, except the number of participants or units installed or sold, are obtained from the previous evaluation. |
| <b>Unitary savings</b>          | Energy or peak demand savings established on a unitary basis. A unit can either be a product (e.g. an 8 W LED lamp), a capacity (e.g. one-tonne capacity of an air-source heat pump), or a participant (e.g. one participant taking part in a behaviour-based program).                                                                      |

## INTRODUCTION

EfficiencyOne (E1), an independent, non-profit organization, is responsible for helping Nova Scotians improve the energy efficiency of their homes and workplaces by designing, marketing, and delivering demand-side management (DSM) for Nova Scotians. E1 provides energy efficiency, demand response and carbon mitigation services through the Efficiency Nova Scotia (ENS) franchise. Regulatory oversight of its DSM activities is provided by the Nova Scotia Utility and Review Board (NSUARB). E1 receives funding for its electricity DSM activities from Nova Scotia Power (NS Power) ratepayers.

E1 has a DSM portfolio of three residential programs, three business, non-profit, and institutional (BNI) programs, and one demand response (DR) program that are marketed to Nova Scotians through the ENS franchise. Each program has one or more program components. Econoler was commissioned by E1 to evaluate E1's 2024 DSM program portfolio.

To carry out these services, Econoler collaborated with Equilibrium Engineering (a brand under the LMMW Group Ltd.), Bouthillette Parizeau, Richard Patterson of CDM Energy Solutions, Narrative Research, and Akonovia. Econoler served as team leader and was involved in every aspect of the evaluation. Specifically, Econoler was in charge of coordinating and supervising all activities, conducting final reviews of all data-collection instruments, performing process and market evaluations and impact evaluation calculations, as well as preparing and reviewing evaluation reports. Bouthillette Parizeau, Richard Patterson, and Akonovia conducted project reviews.<sup>1</sup> Equilibrium Engineering conducted project reviews, on-site visits, and follow-up interviews.<sup>2</sup> Narrative Research conducted interviews and surveys with participants and partners<sup>3</sup> as well as analyzed and reported on the data collected from those activities. Throughout this report, this team is referred to as the Evaluator.

The evaluation confirmed that the E1 DSM program portfolio achieved a total of 172.760 GWh in net electrical energy savings at the generator, 30.688 MW in net peak demand savings at the generator, and 8.091 MW in available demand response capacity in 2024. These net savings represent 81,577 tonnes of CO<sub>2</sub> eq in terms of annually avoided GHG emissions. Total net lifetime electrical energy savings at the generator amounted to 2,430.564 GWh.

---

<sup>1</sup> For the 2024 evaluation, Bouthillette Parizeau and Akonovia conducted project reviews of Custom New Construction projects, while Richard Patterson conducted project reviews of Custom Retrofit and Building Optimization projects.

<sup>2</sup> For the 2024 evaluation, Equilibrium Engineering conducted project reviews complemented by follow-up interviews for AMH projects as well as on-site visits for EPI and SEM projects.

<sup>3</sup> For the 2024 evaluation, Narrative Research conducted surveys with Instant Savings, ASFH, EPI, Green Heat, HEA, and BER participants, as well as with SBES non-participants. They also conducted interviews with AMH participants, non-participants and dropped-out participants, energy auditors, ASFH contractors, BER distributors, Custom participants, non-participant builders, and non-participant or new to program modellers.

# 1 Evaluation Scopes and Objectives

The 2024 Portfolio Evaluation Plan was based on the Evaluation Schedule outlined in the Overall Strategic Evaluation Plan<sup>4</sup> that provides the framework and approach to guide evaluation planning and implementation for the 2023-2025 demand-side management (DSM) activities. The Evaluator is responsible for designing annual evaluation plans that meet the evaluation goals and principles for conducting third-party reviews of E1 program results and reporting evaluated results in evaluation reports.

The following factors are used to guide the prioritization of evaluation activities in the development of annual evaluation plans:

- › The level of program savings compared to portfolio savings: More resources should be allocated to programs that account for a relatively large portion of total portfolio savings.
- › Uncertainty regarding expected savings: Those initiatives with lower uncertainty regarding results should be given a lower evaluation priority. Similarly, evaluation efforts should prioritize those program characteristics or assumptions associated with a higher level of uncertainty.
- › Changes to program design or delivery: Changes to a program that could affect parameters, such as baseline scenarios, indicate that a comprehensive evaluation is likely warranted.
- › Timely feedback in the program life cycle: Information valuable to planning a new initiative (e.g. a pilot) or improving an ongoing program should be prioritized. Process evaluations should be scheduled to obtain early feedback to help ensure that a program is on track to meeting its goals.
- › Regulatory requirements: The information needed to respond to regulatory orders or requirements should be more highly prioritized than the information not needed for that purpose.
- › Evaluation scheduling: The evaluation schedule should be carefully thought out to optimize the robustness and usefulness of evaluation results (e.g. the need to evaluate a program after changes are made to program offerings, the length of the interval between two consecutive evaluations of a program).

There are three broad evaluation categories: Impact evaluations, process evaluations, and market evaluations. Based on the three evaluation categories, Table 1 below presents a summary of the 2024 Portfolio Evaluation Plan. The table also indicates the scopes of the impact evaluations (comprehensive or condensed), which are further detailed in the following subsection.

It should be noted that some program components are further divided into services that are discussed throughout this report. Such is the case for the Custom component that includes the Retrofit, New Construction, Pay-for-Performance, and Building Optimization services as well as for the Business Energy Rebates program component comprised of two services, namely Application Rebates and Instant Rebates.

---

<sup>4</sup> Econoler, Overall Strategic Evaluation Plan, December 2024.

**Table 1: 2024 Portfolio Evaluation Plan**

| Program Components                            | PY2024                     |                |        |
|-----------------------------------------------|----------------------------|----------------|--------|
|                                               | Impact                     | Process        | Market |
| <b>Residential DSM Program Components</b>     |                            |                |        |
| Appliance Retirement                          | Condensed                  |                |        |
| Instant Savings                               | Comprehensive              |                |        |
| Affordable Multifamily Housing                | Comprehensive              | X              |        |
| Affordable Single-family Homes                | Condensed                  | X              |        |
| Efficient Product Installation                | Comprehensive              |                | X      |
| Home Energy Assessment                        | Comprehensive <sup>5</sup> |                |        |
| Green Heat                                    | Comprehensive <sup>6</sup> |                |        |
| Mi'kmaw Home Energy Efficiency Project        | Condensed                  |                |        |
| Residential Behaviour                         | Comprehensive              |                |        |
| New Home Construction                         | N/A                        |                |        |
| <b>BNI DSM Program Components</b>             |                            |                |        |
| Business Energy Rebates – Application Rebates | Condensed                  |                |        |
| Business Energy Rebates – Instant Rebates     | Comprehensive              | X              | X      |
| Custom                                        | Comprehensive              | X <sup>7</sup> |        |
| Strategic Energy Management                   | Comprehensive              |                |        |
| Small Business Energy Solutions               | Condensed                  |                |        |
| <b>Demand Response Program</b>                |                            |                |        |
| Residential Demand Response                   | Comprehensive              |                |        |
| BNI Demand Response                           | Comprehensive              |                |        |

The following subsections describe the objectives of the impact, process, and market evaluations.

## 1.1 Impact Evaluation Objectives and Scope

The impact evaluation activities were aimed at determining:

- › Gross electrical energy and peak demand savings at the meter and at the generator
- › Available demand response (DR) capacity for demand response programs
- › Net-to-gross ratios (NTGRs), including free-ridership and spillover levels where appropriate
- › Net electrical energy and peak demand savings at the meter and at the generator
- › Effective useful life (EUL) values of program measures
- › Gross and net lifetime electrical energy savings at the generator
- › Avoided greenhouse gas (GHG) emissions linked to evaluated gross and net electrical savings

<sup>5</sup> Does not include update to NTGRs.

<sup>6</sup> Does not include update to NTGRs.

<sup>7</sup> For Custom New Construction.

Impact evaluations were conducted for all program components. As explained below, there were two types of impact evaluations:

- › **Comprehensive impact evaluation** – A comprehensive impact evaluation consists of reviewing the following four key elements: (1) The baseline definition; (2) the savings calculation methodology; (3) the values of the parameters used to calculate savings; and (4) NTGRs. The specific activities to be carried out for such reviews may include surveys, project reviews, site visits, billing analyses, literature reviews, etc.
- › **Condensed impact evaluation** – A condensed impact evaluation consists of using all of the previous year's impact evaluation parameters, such as unitary savings values, adjustment ratios, installation rates, and NTGRs, to provide evaluated results.

At least one comprehensive impact evaluation is conducted every three years for all program components with the exception of program components that represent a small proportion of portfolio savings or whose savings calculation methodologies rely on parameters that are evaluated through another program component comprehensive evaluation. To determine which type of impact evaluation (comprehensive or condensed) should be planned for each program component, when they should be conducted, and why, the Evaluator applied the priorities outlined above. For impact evaluations, factors driving uncertainty include:

- › Program maturity and the stability of impact evaluation parameters (e.g. adjustment ratios and free-ridership levels) over time. Mature and stable programs warrant fewer comprehensive impact evaluations.
- › Complexity of savings calculations. Complex or custom savings calculation methodologies that are more likely to result in errors indicate that a comprehensive evaluation is likely warranted.

## Demand-side Management Measure Assessment Document

The impact evaluation scope for 2024 also included an update of the Demand-side Management Measure Assessment (DSM MA) document. This update covered all prescriptive measures and their parameters for the 2024-2025 evaluation period and the semi-prescriptive measures in Business Energy Rebates (BER) – Instant Rebates. There was also a complete review of the top 10 measures in BER Application Rebates and Small Business Energy Solutions (SBES) – the other measures in those program components will simply be transferred from the CIRx Screening Tool<sup>8</sup> to the DSM MA without modifying the algorithms.

The Evaluator conducted a literature review of technical reference manuals, metering studies, and program evaluations to determine if there were more appropriate methodologies or parameters to be applied to the following elements covered in the DSM MA:

- › Unitary energy savings, including baseline assumptions
- › Peak demand-to-energy ratios
- › Interactive effect factors
- › EUL values

The Evaluator reviewed peak demand-to-energy ratios since most of these were obtained based on the modelling conducted for E1's 2016-2018 DSM Plan and new data sources (notably the National Renewable Energy Laboratory ResStock and CommStock models) were available. The Evaluator targeted some end uses for which the 2016-2018 peak demand-to-energy ratios were not sufficiently granular (e.g. if a measure had become important within a program and the current ratios were not adapted to that measure) or if a load shape might have changed since the last model (e.g. the space heating load shape might not have been as representative now that heat pumps were so much more prevalent than they had been 10 years ago).

---

<sup>8</sup> The CIRx Screening Tool is a tool provided by E1 and that presents the savings calculation methodologies, assumptions, and calculation parameters for measures implemented under E1 programs.

The Evaluator also reviewed the interactive effects factors to ensure the methodology was aligned with the most recent information available. The methodology is presented in Appendix IV of the 2024-2025 DSM MA.

In addition, the following parameters, which are planned to be updated annually in the DSM MA, were updated in 2024:

- › LED lighting
  - › Lifetime energy savings
  - › Analysis of wattage for popular models
  - › EUL for measures with a dual baseline
- › Freezer and refrigerator retirements and replacements
  - › Proportion of units per manufacture-year class
  - › Average unit size

## Net-to-gross Ratio Review

The evaluation scope included a NTGR review that served to update the NTGR questionnaires and algorithms for the DSM portfolio so that they were consistent across programs and in line with the latest best practices. The review was focused on the self-report approach applied in past evaluations, which is also the most commonly used approach. The review included:

- › A summary of the latest best practices in NTGR algorithm development, based on a literature review.
- › A review and documentation of the Evaluator's overall approach and detailed rules for NTGR questionnaires and algorithms and how these are aligned with best practices. The set of rules covered topics such as the weighting of intermediate results, treatment of inconsistent results, correct formulation of survey questions, etc.
- › An update to NTGR algorithms used for E1's portfolio of DSM programs to ensure they continue to be aligned with best practices, account for all necessary factors and, where appropriate, use a consistent approach. Please note that this review does not provide an approach to non-participant spillover or market effects.

The deliverable was used to guide the NTGR data collection and analysis for the programs for which a NTGR update was planned for 2024 (i.e. Efficient Product Installation, Business Energy Rebates – Instant Rebates, and Custom; Instant Savings was excluded because data collection occurred early in the year, and the data-collection tool had to be developed before the guide was issued) and will be applied to other programs for the remainder of the current DSM Plan period (i.e. 2023-2025) and, in principle, as long as a self-reporting NTGR approach is used.

## 1.2 Process and Market Evaluation Objectives and Scopes

Two market evaluations were completed in 2024. Market evaluation activities were aimed at achieving the following objectives:

- › Identify new opportunities for residential electrician-installed measures for Efficient Product Installation
- › Analyze the market evolution of BNI lighting for Business Energy Rebates – Instant Rebates

Results from the market evaluations of Efficient Product Installation and Business Energy Rebates – Instant Rebates are presented further below in Section 5.

A total of four process evaluations were completed for Affordable Multifamily Housing, Affordable Single-family Homes, Business Energy Rebates – Instant Rebates, and Custom New Construction respectively.

Process evaluation activities were aimed at achieving the following objectives:

- › Collect information on participant and partner perspectives
- › Analyze barriers to Affordable Multifamily Housing participation, including the design of the operating agreement (affordability covenant)
- › Explore opportunities to expand Custom New Construction presence outside of the multi-unit residential building market
- › Update the Custom New Construction program logic model

Process evaluation results are presented in the relevant evaluation reports.

## 2 Evaluation Methodology

This section presents the methodologies used and the activities carried out to evaluate E1 DSM program components and services through impact, process, and market evaluations.

### 2.1 Impact Evaluation

The impact evaluations were conducted through a range of activities such as tracking sheet audits, data-collection tool development, project reviews assisted by participant follow-up interviews, energy model reviews, on-site visits, as well as other data-collection activities and analyses. The following subsections describe the steps that were followed to conduct the impact evaluations.

#### 2.1.1 Tracking Sheet Audits

The final tracking sheets submitted to the Evaluator by E1 contained both data for all completed projects for 2024 and the tracked results required to calculate final savings. The final tracking sheets were audited to assess the consistency and completeness of program data, including discrepancies that needed to be clarified to enable savings calculations. Following this analysis, the Evaluator determined corrected tracked values and then compiled evaluated savings.

The Evaluator audited the project tracking sheet of each program component. Therefore, the tracked savings results presented in the evaluation reports refer to the corrected tracked savings obtained by the Evaluator as a result of the tracking sheet audits.

#### 2.1.2 Data-collection Tool Development and Sampling Strategy

Data-collection tool development and sampling were carried out for Instant Savings, Affordable Multifamily Housing (AMH), Affordable Single-family Homes (ASFH),<sup>9</sup> Efficient Product Installation (EPI), Green Heat, Home Energy Assessment (HEA), Business Energy Rebates (BER), Custom, Small Business Energy Solutions (SBES), and Strategic Energy Management (SEM).

The Evaluator developed the relevant data-collection instruments, namely survey questionnaires, interview guides and project review protocols. Data-collection instruments were informed by the results of documentation reviews, program staff interviews, and preliminary tracking sheets.

Using an integrated approach, the data-collection tools also included questions to inform select process and market evaluation activities.

---

<sup>9</sup> While the survey was aimed solely at process data collection, it was included in this section for completeness.

## 2.1.3 Data Collection

### Surveys and Interviews

This subsection describes the data-collection activities conducted for the impact evaluations. It should be noted that surveys and interviews were often integrated to collect impact, process, and market information as discussed in Subsection 2.2 below.

- › **Participant and non-participant surveys** were used to collect data on free-ridership and spillover, insights to establish billing analysis results (Home Energy Assessment and Green Heat) and to reassess unconverted D assessment savings parameters (Home Energy Assessment). Most surveys were conducted by telephone with the exception of online surveys conducted for Instant Savings, Green Heat, and Home Energy Assessment. Between September and December 2024 inclusively, the Evaluator conducted surveys with 1,239 participants and non-participants. Table 2 below lists the surveys completed for each program component and the number of respondents to each survey. Note that Table 1 includes all surveys completed as part of the 2024 evaluation for completeness.

**Table 2: 2024 Participant and Non-participant Surveys**

| Program Component                             | Number of Respondents |
|-----------------------------------------------|-----------------------|
| <b>Residential</b>                            |                       |
| Instant Savings                               | 200                   |
| Affordable Single-family Homes                | 60                    |
| Efficient Product Installation                | 100                   |
| Green Heat – Past Participants                | 240                   |
| Home Energy Assessment - Expired Participants | 76                    |
| Home Energy Assessment - Past Participants    | 483                   |
| <b>BNI</b>                                    |                       |
| Business Energy Rebates – Instant Rebates     | 50                    |
| Small Business Energy Solutions               | 30                    |
| <b>Total</b>                                  | <b>1,239</b>          |

- › **In-depth interviews** with program staff, participants, and partners were conducted as part of impact evaluation activities to collect data on free-ridership and spillover. Between September 2024 and January 2025 inclusively, the Evaluator conducted 105 interviews with various market actors and stakeholders. The number of completed interviews for each program component is presented in Table 3 below. Note that Table 3 includes all in-depth interviews completed as part of the 2024 evaluation for completeness. In-depth interviews aimed solely at market and process data collection only are indicated in green.

**Table 3: 2024 Interviews Completed**

| Program Component                      | Program Manager/1<br>E1 Staff/Business<br>Development Manager | Service Providers/<br>Distributors/<br>Contractors | Participants    | Non-<br>participants | Dropped-out or<br>Overdue<br>Participants |
|----------------------------------------|---------------------------------------------------------------|----------------------------------------------------|-----------------|----------------------|-------------------------------------------|
| <b>Residential</b>                     |                                                               |                                                    |                 |                      |                                           |
| Appliance Retirement                   | 1                                                             | -                                                  | -               | -                    | -                                         |
| Instant Savings                        | 2                                                             | -                                                  | -               | -                    | -                                         |
| Affordable Multifamily Housing         | 2                                                             | 4                                                  | 11 <sup>2</sup> | 10                   | 8 <sup>3</sup>                            |
| Affordable Single-family Homes         | 2                                                             | 9 <sup>4</sup>                                     | -               | -                    | -                                         |
| Efficient Product Installation         | 2                                                             | -                                                  | -               | -                    | -                                         |
| Green Heat                             | 2                                                             | -                                                  | -               | -                    | -                                         |
| Home Energy Assessment                 | 2                                                             | -                                                  | -               | -                    | -                                         |
| Mi'kmaw Home Energy Efficiency Project | 2                                                             | -                                                  | -               | -                    | -                                         |
| Residential Behaviour                  | 2                                                             | -                                                  | -               | -                    | -                                         |
| <b>BNI</b>                             |                                                               |                                                    |                 |                      |                                           |

<sup>1</sup> Two rounds were performed with the program manager (round 1 in May 2024 and round 2 in September 2024) except for Appliance Retirement (ARet).

<sup>2</sup> AMH: Includes one impact interview as part of project reviews and 10 as part of the process evaluation.

<sup>3</sup> AMH: Includes two partial interviews with two prescriptive path dropped-out participants.

<sup>4</sup> ASFH: Five interviews were conducted with contractors and four interviews were conducted with delivery agents.

<sup>5</sup> Custom: Four program manager interviews were conducted (two for New Construction and two for Retrofit) as well as an interview with the Business Development Manager and another with the Program Manager (for New Construction as part of the process evaluation).

<sup>6</sup> Custom: Eight interviews were conducted with builder participants for New Construction and 14 interviews were conducted with participants for Retrofit.

## Site Visits and Project Reviews with Follow-up Site Visits or Interviews

The Evaluator performed a total of 146 project reviews during the summer and fall of 2024, 70 of which were complemented through site visits and 14 were complemented through phone interviews.

For Efficient Product Installation, site visits were conducted to validate the installation rates of implemented measures.

For Affordable Multifamily Housing, Custom, Strategic Energy Management, and BNI Demand Response, the Evaluator carried out full technical reviews of project documentation and followed up through telephone interviews or site visits with participants to finalize the project reviews when required. The telephone interviews were also used to collect information on free-ridership and spillover as well as participant perspectives on the program component where relevant. For one new Strategic Energy Management participant, a site visit was also conducted.

Table 4 indicates the number of site visits and project reviews conducted for each program component. The complete results of the on-site visits are provided in the relevant program component evaluation reports.

**Table 4: 2024 Site Visits and Project Reviews with Follow-up Site Visits or Interviews**

| * Custom: 34 project reviews were conducted (20 for Retrofit, 12 for New Construction and two for Building Optimization). Of the 20 Retrofit project reviews, 19 project reviews for regular Retrofit projects were included in the adjustment ratio calculation. One large-scale compressed air leak audit project was reviewed and was not included in the adjustment ratio calculation. |                                         |                                              |                                                         |                  |                                      |

## Energy Model Reviews

The Evaluator performed energy model reviews for the 12 Custom New Construction projects to verify the accuracy of energy models. After the initial file reviews, the Evaluator concluded that the available documentation was sufficient and site visits or follow-up phone interviews were not required. The energy model reviews involved comparing energy models against as-built drawings and project documentation. The Evaluator also compared baseline energy models against the appropriate baseline definition for each project. The resulting adjusted models were then used to establish evaluated savings.

## Unitary Savings Review

As part of the update to the 2024-2025 DSM MA that was reviewed in its entirety in 2024, for program components with unitary savings values - namely Appliance Retirement, Instant Savings, Home Energy Assessment, Green Heat, Efficient Product Installation, the Mi'kmaw Home Energy Efficiency Project, Business Energy Rebates – Instant Rebates, and the Small Business Energy Solutions Commercial Direct Installation pilot - the Evaluator validated the parameters and equations used to obtain the values and updated them where necessary through the development of the 2024-2025 DSM MA. Parameters or calculation methodologies for new measures added to the DSM MA in 2024 were also reviewed and the 2024-2025 DSM MA was updated accordingly. The measures added to the 2024-2025 DSM MA included advanced learning thermostats for central heating systems, humidity sensors for bathroom exhaust fans, and solar photovoltaic systems in the residential sector as well as horticultural lighting in the commercial sector. Unitary savings values were reviewed using one or more of the following approaches: Literature reviews of technical reference manuals; metering studies; billing analyses; energy models; evaluation reports; engineering calculations; adjustments based on data collected through participant surveys or site visits; and secondary research about household/facility characteristics such as types of heating and cooling systems.

### Billing Analyses

In 2024, three billing analyses were performed for Green Heat, Home Energy Assessment, and Residential Behaviour. The Green Heat billing analysis was conducted to obtain measured electrical energy savings generated through the installation of MSHPs and wood or pellet stoves or fireplace inserts. The results were used to update the unitary savings values for these measures.<sup>10</sup> The Home Energy Assessment billing analysis was conducted to establish adjustment ratios to be directly applied to the savings estimates obtained from HOT2000.<sup>11</sup> The past participant surveys were used to identify participants that had modified their homes while participating in Home Energy Assessment and Green Heat (for example, by adding heating to rooms that were not previously heated or by increasing the floor area of their home), and those participants were removed from the billing analysis since a pre and post-participation analysis of their energy consumption would not accurately represent the electrical energy savings associated to the measures installed. Finally, the Residential Behaviour billing analysis was performed to calculate net electrical energy savings, including a comparison of the treatment and control group electricity consumption levels using a difference-in-difference approach.

#### 2.1.4 Effective Useful Life Review

As part of the DSM MA update in 2024, the Evaluator reviewed the EUL values for existing and new measures to ensure they were valid and revised them where appropriate. The EUL update was based on a literature review of the most recent technical reference manuals from other jurisdictions. The resulting EUL values were included in the 2024-2025 DSM MA.

In addition, for some measures, the Evaluator considered not only the measure life, but also the evolution of the baseline over the lifetime of the measure. Lifetime electrical energy savings were calculated based on the existing baseline until the end of the period when the equipment would have been replaced and then based on the new standard baseline for the remaining EUL of the measure. The adjusted EUL of a given project was then calculated as the lifetime electrical energy savings divided by first-year electrical energy savings.

---

<sup>10</sup> Results from the Green Heat billing analysis were also applied to Affordable Single-family Homes non-modelled heat pumps, and the updated full-load-hours was applied to Affordable Multifamily Housing heat pumps projects.

<sup>11</sup> Results from the Home Energy Assessment billing analysis were also applied to Affordable Single-family Homes and Mi'kmaw Home Energy Efficiency Project modelled savings.

## 2.1.5 Gross Savings Analysis

Gross savings refer to changes in energy consumption resulting from actions taken by participants regardless of their reasons for participating in a program. Upon completion of the impact evaluation activities described above, the Evaluator analyzed the data collected to calculate evaluated gross savings and compare results with the data tracked by E1. Establishing gross savings consists of compiling all measures savings implemented through a program component along with the evaluated parameters.

## 2.1.6 Net Savings Analysis

### Net-to-gross Assessment and Net Savings Calculations

Free-ridership levels were established for select program components by conducting self-report surveys or in-depth interviews. Those surveys and interviews included a set of questions used to establish program component attributions for the free-ridership calculations. The self-report approach consisted of asking questions to participants to assess factors such as planning, quantity, efficiency, period, and cost as well as the influence of a given program component. For the midstream BER – Instant Rebates program component, both market actor (distributor) and end-user (participant) perspectives were used to assess free-ridership. Based on survey or interview results, a free-ridership level was established for each respondent. Subsequently, a weighted average based on each respondent's savings was used to estimate overall program component free-ridership levels. The free-ridership calculation methodology also takes into account the impact of cross-influence of previous participation in other E1 program components.

As part of the 2024 evaluation, free-ridership levels were updated for Instant Savings, Efficient Product Installation, Business Energy Rebates – Instant Rebates, as well as Custom Retrofit and New Construction. The NTGR review, as discussed in Subsection 1.1 above, guided the data collection and analysis of all program components except for Instant Savings since that data collection occurred too early in the year.

The free-ridership levels from past evaluations were used for Appliance Retirement, Home Energy Assessment, Green Heat, Business Energy Rebates – Application Rebates, Custom Pay-for-Performance, Building Optimization, as well as Small Business Energy Solutions.

The impact evaluations included an assessment of spillover levels for program components wherein spillover was a factor. For all program components with the exception of Instant Savings and Home Energy Assessment, the spillover levels corresponded to participant spillover. Participant spillover assessments were conducted through telephone surveys or during follow-up interviews or site visits during project reviews. In all cases, participants were asked if they had implemented additional energy efficiency measures without receiving additional funding or assistance from E1. If so, participants were then asked a set of questions designed to identify the additional energy efficiency measures implemented and their associated savings. Subsequently, another question was asked to quantify the level of influence a given program component had on their decision to implement the additional measures. Thereafter, the value established on the level of influence was used to determine the portion of the additional savings attributable to the given program component. Finally, the level of participant spillover was established by dividing the total additional savings attributable to the program component by the total savings achieved by said component for all survey respondents.

As part of the 2024 evaluation, the spillover levels were updated for Efficient Product Installation and Custom. The spillover levels from past evaluations were used for Appliance Retirement, Instant Savings, Home Energy Assessment, and Business Energy Rebates – Application Rebates. In addition, the 2024 unconverted D assessment spillover was updated for Home Energy Assessment.

For Small Business Energy Solutions, the Evaluator conducted a survey with non-participants from a sample of commercial customers to assess non-participant spillover.

The Evaluator did not establish free-ridership and spillover levels for measures and program components offered to low-income participants as they were considered to have nil free-ridership and spillover levels.

## **Avoided GHG Emission Calculations**

The Evaluator estimated the avoided annual GHG emissions resulting from the evaluated electrical energy savings generated through all program components. Avoided GHG emissions were estimated by using a Nova Scotia-specific factor<sup>12</sup> for GHG emissions generated by electricity production. This factor was updated with the most recent NS Power data on total system emissions and electricity generation.

## **2.2 Process and Market Evaluations**

Process and market evaluations were conducted using a range of activities such as program component documentation as well as secondary data reviews, jurisdictional scans, logic model reviews, as well as participant surveys and in-depth interviews with program staff, stakeholders, and participants. The following subsections describe the key tasks the Evaluator carried out for the market evaluations of Efficient Product Installation and Business Energy Rebates – Instant Rebates and the process evaluations of Affordable Multifamily Housing, Affordable Single-family Homes, Business Energy Rebates – Instant Rebates, and Custom New Construction.

### **Documentation Review**

The Evaluator reviewed all relevant evaluation and program component-specific documentation such as program manuals, marketing materials, application forms, tracking sheets, and any other information on changes made to program components since the previous evaluation. Additionally, the Evaluator used annual staff interviews to follow up on past evaluation recommendations and become aware of any program component improvements and changes.

### **Data-collection Tool Development and Sampling Strategy**

As described in Subsection 2.1.2 above, the Evaluator used an integrated approach to developing data-collection tools that serve all evaluation types where possible. For instance, survey instruments and interview guides included questions for process, market, and impact evaluations. This approach reduces respondent burden and ensures that evaluation results are integrated.

---

<sup>12</sup> At the time of writing, 2024 data were not yet available. The Nova Scotia-specific factor was obtained from Nova Scotia Power's 2023 total system emissions data (4,931,152 CO<sub>2</sub> eq tonnes), and total electricity generation (10,442 GWh) was drawn from the following two sources: Nova Scotia Power, Total System Emissions, <https://www.nspower.ca/clean-energy/air-emissions-reporting> (last accessed September 27, 2024) and Emera Inc., Emera Inc. 2023 Annual Report, p. 31, available at [https://s25.q4cdn.com/978989322/files/doc\\_financials/2023/ar/Emera\\_2023\\_AR\\_FINAL.pdf](https://s25.q4cdn.com/978989322/files/doc_financials/2023/ar/Emera_2023_AR_FINAL.pdf) (last accessed September 27, 2024).

## Data Collection

This subsection describes the data-collection activities conducted for the process and market evaluations. As discussed above, surveys and interviews were integrated where applicable to collect information for the impact, process, and market evaluations.

- › **Secondary data** were used to inform analysis of New Construction participation across building types and regions.
- › **In-depth interviews** were conducted with program staff, Business Development Managers, participants, partners, and trade allies to collect data on their involvement in a given program component as well as their experience and satisfaction with it, among other things. Unlike participant surveys that require interviewers to ask questions in the exact same way, in-depth interviews are semi-directed, thus allowing for more flexibility and discussion. They are a great option for evaluations that require exploring certain research areas or asking in-depth and complex questions that are not suited to a survey. The number of completed interviews for each program component is presented in Table 3, Subsection 2.1.3 above.
- › **Participant surveys** conducted by phone between October and November 2024 with participants in New Construction, Affordable Single-family Homes, as well Business Energy Rebates – Instant Rebates served to collect information on their perspectives about the program components and service. The number of completed surveys is presented in Table 2, Subsection 2.1.3 above.

## Jurisdictional Scan

The Evaluator conducted a jurisdictional scan across other jurisdictions throughout Canada and the United States (US) to identify other measures that could be installed by electricians under Efficient Product Installation. In addition, the Evaluator conducted a jurisdictional scan examining characteristics of new construction programs across North America.

## Logic Model Update

The Evaluator reviewed the Custom New Construction logic model to assess how well the program logic and theory of change address barriers to achieving program objectives. To do so, the Evaluator reviewed the most recent program logic model and underlying theory of change provided by E1 to examine program objectives and barriers.

## Analysis

The results of the process and market evaluation activities were analyzed in relation to the research objectives identified in Subsection 1.2 above. The results from all evaluation activities were consolidated and triangulated to ensure that findings were based on a preponderance of results.

## 3 Impact Evaluation Results

This section presents an analysis of the impact evaluation results for all program components by comparing 2024 tracked electrical energy and peak demand savings with evaluated electrical energy and peak demand savings. Evaluated NTGRs, lifetime electrical energy savings, and GHG emission reductions are also presented in the subsections below.

### 3.1 Individual Impact Evaluation Results

Table 5 and Table 6 below respectively list the evaluated electrical energy and peak demand savings as well as the corresponding savings tracked by E1 for each program component offered in 2024. Net savings were calculated by multiplying gross savings by the NTGR. Lifetime energy savings are equal to the savings generated by efficiency measures over their EUL. The line loss factors correspond to the values submitted to the Nova Scotia Utility and Review Board (NSUARB) as part of the 2014 Cost of Service Study Progress Update.<sup>13</sup>

<sup>a</sup> Numbers may not add up due to rounding.

<sup>b</sup> Subtotal NTGR values represent average values for the Residential and BNI portfolios. The Portfolio Total NTGR value represents an average value for all programs. There were no tracked savings for Residential Behaviour.

<sup>d</sup> Evaluated gross and net electrical energy savings at the generator include 0.135 GWh generated by the Commercial Direct Install Pilot.

<sup>e</sup> Residential Behaviour was excluded from the evaluated net savings used to calculate the realization rate, as there were no tracked savings.

The Portfolio Total NTGR value represents an average value for all programs.<br><sup>c</sup> Evaluated gross and net peak demand savings at the generator include 0.020 MW generated by the Commercial Direct Install Pilot.<br><sup>d</sup> Tracked results weren't fully compiled since multiple methodologies on how to establish the available DR capacity of the measures included in 2024 were being considered.<br><sup>e</sup> Residential DR was not considered in the difference in available capacity (MW) or in the realization rate calculation, as there were no tracked savings.<br><sup>f</sup> This net realization rate does not include the DR program. |                                              |                           |                         |                         |                           |                   |                         |                         |                                |                                       |                      |

The following subsections discuss how evaluated savings compared to E1 tracked savings, and participation for each program and component.

### 3.1.1 Residential DSM Programs

#### Residential Efficient Product Rebates

In 2024, Residential Efficient Product Rebates achieved net electrical energy and peak demand savings of 24.617 GWh and 2.765 MW respectively at the generator. The two components under this program are Appliance Retirement (ARet) and Instant Savings. The results of each program component are provided below.

##### Appliance Retirement

- › The evaluated net electrical energy savings and peak demand savings determined by the Evaluator were respectively equal to and slightly lower than the net savings and peak demand savings tracked by E1.
- › Program participation levels in 2024 increased by 39% compared to 2023, with refrigerator and freezer retirements remaining, as was the case in 2023, the largest drivers of participation and savings.

##### Instant Savings

- › Participation levels in 2024 increased by 82% compared to 2023 levels, likely driven by E1's Lights Out campaign, with ENERGY STAR® certified LED fixtures and ENERGY STAR certified non-A-type LED lamps being the largest drivers of participation.
- › Savings from products other than lighting increased in 2024 compared to 2023 levels, and most savings continued, as was the case in 2023, to come from LED lighting products.
- › The free-ridership level for both LED lamps and LED fixtures decreased in 2024 compared to 2023 levels.
- › The evaluated net electrical energy savings and net peak demand savings determined by the Evaluator were higher than the net savings tracked by E1.

#### Existing Residential

In 2024, the net electrical energy savings for Existing Residential reached 53.331 GWh at the generator, while the net peak demand savings amounted to 14.229 MW at the generator. Existing Residential is comprised of Affordable Multifamily Housing, Affordable Single-family Homes, Efficient Product Installation, Green Heat, Home Energy Assessment, the Mi'kmaw Home Energy Efficiency Project, and Residential Behaviour. The results of these seven program components are discussed below.

##### Affordable Multifamily Housing

- › Despite a slight increase (5%) in participation compared to 2023 levels, AMH achieved lower gross electrical energy and peak demand savings than in 2023.
- › In 2024, prescriptive projects generated the most gross electrical energy savings (80%) and the most gross peak demand savings (88%) since inception.
- › Following project reviews, the Evaluator made an overall upward adjustment to electrical energy savings and a downward adjustment to peak demand savings. For electrical energy savings, a small upward adjustment ratio applied to prescriptive heat pump projects (1.016) was almost cancelled out by a one-time downward adjustment (0.010 GWh) from comprehensive projects. For peak demand savings, one-time downward adjustments were calculated for both prescriptive lighting and comprehensive projects (0.003 MW and 0.006 MW respectively).

- 
- › The net evaluated electrical energy savings were nearly the same as those tracked by E1 and the net evaluated peak demand savings were slightly lower than those tracked by E1. These differences are due to the adjustments applied by the Evaluator following the project reviews.

### Affordable Single-family Homes

- › In 2024, 1,210 homes participated in Affordable Single-family Homes and 1,193 of them generated electrical energy savings.
- › The net electrical energy and peak demand savings determined by the Evaluator were respectively 21% lower and 3% lower than the initial savings tracked by E1. These were mainly due to revisions to the adjustment ratios as a result of the billing analysis performed for HEA using HOT2000.

### Efficient Product Installation

- › Compared to 2023 levels, participation in 2024 increased by 2% while average electrical energy savings per participant decreased by 6.3%. This reduction in savings per participant was mainly due to the update to the 2024-2025 DSM MA, notably downward adjustments to smart thermostat and LED lamp unitary savings.
- › The evaluated net electrical energy savings were 6% lower than the tracked net electrical energy savings, while the evaluated net peak demand savings were 1% higher than the tracked net peak demand savings mostly due to updates made to the 2024-2025 DSM MA and to NTGR levels.

### Green Heat

- › Green Heat participation levels decreased by 21% compared to 2023 levels, particularly for MSHPs and demand reduction measures for which participation decreased by 36% and 19% respectively.
- › The net evaluated electrical energy and peak demand savings were significantly lower than the savings tracked by E1 due to the update to unitary savings for MSHPs and biomass measures as a result of the billing analysis completed as part of the 2024 evaluation.

### Home Energy Assessment

- › With 5,367 projects, the 2024 participation level was the highest observed since the program component was launched. The average gross electrical energy savings per home slightly decreased compared to 2023 levels, although they remained high compared to previous years. These high results were driven by the integration of the Canada Greener Homes Grant (CGH Grant).
- › The Evaluator undertook a billing analysis in 2024 and determined updated adjustment ratios (ARs) for modelled savings.
- › The evaluated electrical energy and peak demand savings were higher than the savings tracked by E1 due to updates made to the 2024-2025 DSM MA and results of the billing analysis conducted as part of the 2024 evaluation.

### Mi'kmaw Home Energy Efficiency Project

- › While MHEEP achieved the highest participation since its inception with an increase of 19%, the average energy savings per participant decreased by 41%, generating 31% lower gross energy savings and 29% higher gross peak demand savings in 2024 compared to 2023 levels.
- › The evaluated net electrical energy and peak demand savings determined by the Evaluator were respectively lower and higher than the initial net savings tracked by E1.

## Residential Behaviour

- › E1 did not track savings for Residential Behaviour, which relies on a random selection of treatment group of participants among all residential customers in 2024. Therefore, the program component does not have a tracking sheet, and there is no realization rate.

### 3.1.2 Business, Non-profit, and Institutional DSM Programs

#### Efficient Product Rebates

Efficient Product Rebates is comprised of one program component, Business Energy Rebates, which is further comprised of two services, namely Application Rebates and Instant Rebates. In 2024, Business Energy Rebates achieved 39.529 GWh in net electrical energy savings at the generator and 5.746 MW in net peak demand savings at the generator. The results of the program are provided below.

#### Business Energy Rebates

- › In 2024, Instant Rebates participation decreased by 26% compared to 2023 levels. Application Rebates participation increased by 18% in 2024, while gross electrical energy savings per Application Rebates participant increased by 16% compared to 2023 levels.
- › The Instant Rebates free-ridership algorithm was updated in 2024, LED linear fixture free-ridership decreased from 14% in 2022 to 8%, LED linear lamp free-ridership decreased from 27% in 2022 to 15%, and LED outdoor fixtures decreased from 18% in 2022 to 15%. The increase in the NTGR and the increase in both unitary energy and peak demand savings for indoor (fixture-mounted or wall-switch) and outdoor occupancy/motion sensors resulted in evaluated net electrical energy and peak demand savings being slightly higher than the values tracked by E1.
- › Both evaluated net electrical energy savings and peak demand savings were identical to the values tracked by E1 for Application Rebates. Evaluated net electrical energy and peak demand savings were both 4% and 6% higher respectively than tracked results for Instant Rebates.

#### Custom Incentives

In 2024, Custom Incentives achieved 44.429 GWh in net electrical energy savings and 5.793 MW in net peak demand savings at the generator through its two components, namely Custom and Strategic Energy Management. Custom comprises four services, Retrofit, Pay-for-Performance, New Construction, and Building Optimization. The results of both program components are provided below.

#### Custom

- › Compared to 2023, Custom participation decreased in 2024. While Retrofit and Building Optimization participation levels decreased, New Construction participation significantly increased in 2024.
- › Following the project reviews, the Evaluator adjusted the electrical energy and peak demand savings for Retrofit, New Construction, and Building Optimization.
- › Retrofit free-ridership levels decreased for regular Retrofit and New Construction projects and was established at 15% and 28% respectively. Retrofit spillover was nil for regular Retrofit projects, and free-ridership and spillover were not measured for Building Optimization; 2023 levels were therefore maintained and used for the 2024 evaluation.
- › Evaluated net electrical energy and peak demand savings determined by the Evaluator were respectively 8% and 5% higher than the savings tracked by E1.

## Strategic Energy Management

- › The SEM participation level has remained stable over the past five years. Electrical energy savings per participant were similar to those in 2023.
- › The measurement and verification (M&V) methodologies applied to quantify savings were generally appropriate and accurate. The quality of peak demand savings estimates was greatly improved compared to previous years.
- › The evaluated net electrical energy and peak demand savings determined by the Evaluator were almost equal to the initial net savings tracked by E1.

## Direct Installation

Direct Installation consists of one program component, namely Small Business Energy Solutions. In 2024, Direct Installation achieved 10.644 GWh in net electrical energy savings at the generator and 2.151 MW in net peak demand savings at the generator. The results of the program are provided below.

### Small Business Energy Solutions

- › In 2024, the number of units rebated under Small Business Energy Solutions increased by 53% compared to 2023 levels, with the DIY path remaining the most popular and accounting for 98% of all units rebated.
- › Based on the results of a survey conducted with 30 businesses, non-participant spillover was found to be nil.
- › The evaluated gross and net electrical energy and peak demand savings were slightly higher (by 1% and 5% respectively) than the savings tracked by E1 due to updates made to the 2024-2025 DSM MA.

## 3.1.3 Demand Response DSM Programs

### Demand Response

Demand Response is comprised of two program components, Residential Demand Response, and Business, Non-profit, and Institutional Demand Response. In 2024, Demand Response achieved 8.091 MW in available demand response capacity. The results of each program component are provided below.

#### Residential Demand Response

- › Tracked results were not fully compiled, as multiple methodologies for establishing the available DR capacity of the measures included in 2024 were being considered. The Evaluator decided on the final methodology to be used as part of the 2024 evaluation. Therefore, the program component does not have tracked results, nor realization rate.

#### Business, Non-profit, and Institutional Demand Response

- › Participation grew over 700% from nine participants last year to 76 participants this year. The available DR capacity per participant decreased from 263 kW in 2023 to 106 kW in 2024.
- › The evaluated new and total available DR capacities were 1% and less than 1% lower than the values tracked by E1 respectively. The differences are due to the adjustments made through the project reviews.

## 3.2 Net-to-gross Ratios

The NTGRs outlined in Table 7 below were applied to gross savings to estimate net savings. NTGRs were established based on the free-ridership levels and spillover in some cases. Based on the established free-ridership and spillover levels, NTGRs were calculated using the following equation.

$$NTGR = (1 - \% \text{ Free-ridership} + \% \text{ Spillover})$$

NTGR estimations were based on a self-reporting approach and the methodology described in Subsection 2.1.6 above.

Table 7 summarizes the free-ridership and spillover levels used in the 2024 evaluation as well as the resulting NTGRs for each program component.

**Table 7: 2024 Free-ridership, Spillover, and NTGRs**

| Program Component and Measure Type  |                            | Free-ridership Levels | Spillover Levels | NTGR |
|-------------------------------------|----------------------------|-----------------------|------------------|------|
| <b>Residential</b>                  |                            |                       |                  |      |
| Appliance Retirement <sup>a</sup>   | Refrigerators              | 43%                   | 0%               | 0.57 |
|                                     | Freezers                   | 45%                   |                  | 0.55 |
|                                     | Air Conditioners           | 47%                   |                  | 0.53 |

<sup>a</sup> Net-to-gross ratios were determined based on the results of past evaluations.

### 3.3 Lifetime Energy Savings

The Evaluator reviewed the EUL values of all measures offered by E1 and their associated lifetime electrical energy savings. The Evaluator found that the DSM portfolio generated 2,424.024 GWh in lifetime net

electrical energy savings.<sup>14</sup> As presented in Table 8 below, the weighted average EUL of measures offered in the E1 DSM portfolio is 14.1 years. Program components with measures affecting building envelopes, such as insulation, generate significant lifetime savings due to the persistence of these types of measures. For example, Home Energy Assessment has an average EUL of 26.9 years and, while it contributes to 19% of annual electrical energy savings of the DSM portfolio, it generates 35% of lifetime energy savings. Program components composed of mainly lighting measures, such as Instant Savings and Efficient Product Installation, generate lower lifetime electrical energy savings compared to annual savings due to the shorter equivalent EUL of these types of measures.

**Table 8: 2024 Evaluated Net Lifetime Electrical Energy Savings at the Generator**

| DSM Program                               | Program Component                      | Annual Net Energy Savings (GWh) | Lifetime Net Energy Savings (GWh) | Weighted Average EUL (years) | Share of Annual Net Energy Savings (%) | Share of Lifetime Net Energy Savings (%) |

<sup>14</sup> The Demand Response program is not included since no electrical energy savings were generated, and it generated available demand response capacity only.

### 3.4 Greenhouse Gas Emission Reductions

The Evaluator established the reduced GHG emissions due to the DSM portfolio at 81,327 tonnes of CO<sub>2</sub> eq in terms of annually avoided net GHG emissions. Table 9 below presents the GHG emission reductions of each program component in 2024 as well as those for the portfolio as a whole.<sup>15</sup>

**Table 9: 2024 Evaluated GHG Emission Reductions**

| DSM Program                             | Program Component                      | Gross Annual Avoided GHG Emissions in CO <sub>2</sub> eq Tonnes | Net Annual Avoided GHG Emissions in CO <sub>2</sub> eq Tonnes |
|-----------------------------------------|----------------------------------------|-----------------------------------------------------------------|---------------------------------------------------------------|

## 4 DSM Portfolio Performance

This section presents a comparison of evaluated savings with E1 planned savings at the program and component levels. It also presents satisfaction results, annual savings performance, as well as the historical performance and contribution of individual program components to portfolio savings.

### 4.1 Participant and Partner Satisfaction

The 2024 evaluation revealed high participant satisfaction with E1 and its programs. Affordable Multifamily Housing, Affordable Single-family Homes, Efficient Product Installation, Custom (New Construction), and Business Energy Rebate – Instant Rebates received, on average, participant satisfaction scores of 7.9 or higher. The Evaluator interviewed program partners for two program components. Program partners were generally satisfied with the program components, while they were less satisfied than participants. Table 10 presents the 2024 average participant and partner satisfaction scores for program components for which this metric was measured. A 0-to-10 scale is used to score satisfaction, where 0 means “Not at all satisfied” and 10 means “Completely satisfied”.

**Table 10: 2024 Satisfaction Results**

| DSM Program                | Program Component                        | Participant Satisfaction          | Partner Satisfaction                       |

| * Planned savings correspond to E1 mid-course adjustments.<br>** Numbers may not add up due to rounding. |                          |                              |                            |                          |                              |                            |            |             |

The E1 DSM portfolio of program components achieved 172.760 GWh in total net electrical energy savings at the generator and 30.688 MW in total net peak demand savings at the generator, representing 21% higher savings than planned electrical energy savings and 20% higher savings than planned peak demand savings for 2024. Residential Efficient Product Rebates, Existing Residential, and Custom Incentives exceeded their planned electrical energy and peak demand targets in 2024, while Efficient Product Rebates and Direct Installation fell just short of targets.

E1 residential programs achieved 77.948 GWh in net electrical energy savings at the generator and 16.994 MW in net peak demand savings at the generator. Residential energy savings were 28% higher than planned, with all programs exceeding their targets. The results were as follows: Residential Efficient Product Rebates and Existing Residential surpassed their targets by 70% and 15% respectively. All residential programs also exceeded their peak demand savings targets, with Residential Efficient Product Rebates exceeding the target by 41% and Existing Residential by 24%. As a result, residential net peak demand savings were 26% above the planned values.

E1 BNI programs achieved 94,812 GWh in net electrical energy savings at the generator and 13.694 MW in net peak demand savings at the generator in 2024, thus exceeding planned electrical energy savings and planned peak demand savings by 16% and 12% respectively. Efficient Product Rebates narrowly missed their electrical energy savings target by 1%, while Custom Incentives and Direct Installation exceeded their electrical energy savings target by 42% and 2% respectively. Efficient Product Rebates and Custom Incentives exceeded their planned peak demand savings target by 13% and 27% respectively, while Direct Installation missed its target by 16%.

## 4.3 Historical Portfolio Analysis

This subsection presents year-over-year program performance (GWh energy savings) and the contribution of individual program components to portfolio savings (% energy savings). Table 12, Table 13, and Table 14 below provide a historical overview of program component performance and changes in DSM portfolio composition from 2020 to 2024.

**Table 12: Evaluated Net Electrical Energy Savings at the Generator, 2020-2024**

| DSM Program                                                                                                                                                      | Program Component                           | Energy Savings (GWh) |         |         |         |         | Energy Savings (%) |      |      |      |      |

| <sup>a</sup> Residential Behaviour is not included.                                                                                                         |                                             |                          |        |        |        |        |                         |      |      |      |      |
| <sup>b</sup> Affordable Single-family Homes was introduced in 2024.                                                                                         |                                             |                          |        |        |        |        |                         |      |      |      |      |
| <sup>c</sup> Custom includes four services: Retrofit, Pay-for-Performance, New Construction, and Building Optimization.                                     |                                             |                          |        |        |        |        |                         |      |      |      |      |
| <sup>d</sup> Strategic Energy Management includes Energy Management Information Systems. In 2023, the two program components were merged into a single one. |                                             |                          |        |        |        |        |                         |      |      |      |      |

**Table 14: Evaluated Net Available DR Capacity, 2023-2024**

| DSM Program              | Program Component           | Available DR Capacity (MW) |       | Available DR Capacity (%) |      |
|--------------------------|-----------------------------|----------------------------|-------|---------------------------|------|
|                          |                             | 2023                       | 2024  | 2023                      | 2024 |
| Demand Response (DR)     |                             |                            |       |                           |      |
| Demand Response          | Residential Demand Response | 0.058                      | 0.057 | 2%                        | 1%   |
|                          | BNI Demand Response         | 2.365                      | 8.034 | 98%                       | 99%  |
| Demand Response Subtotal |                             | 2.423                      | 8.091 | 100%                      | 100% |

In 2024, E1 achieved a total of 172.760 GWh in net electrical energy savings at the generator and 30.688 MW in net peak demand savings at the generator. Both net electrical energy and peak demand savings increased compared to 2023 levels. Residential programs had increases in net electrical energy and peak demand savings of 30% and 2% respectively compared to 2023 levels, while BNI programs had 33% and 25% increases in net electrical energy and peak demand savings respectively.

In 2024, the residential sector accounted for 45% of net electrical energy savings and the BNI sector accounted for 55% of net electrical energy savings. Compared to 2023, while the share of lighting in residential programs increased from 6% to 10% in 2024, largely driven by Instant Savings, the share of lighting in BNI programs decreased from 30% to 24%. For the overall portfolio, savings from lighting slightly decreased from 36% to 34% in 2024.

The residential sector accounted for 55% of net peak demand savings, while the BNI sector accounted for the other 45%. In 2024, the program components that generated the largest shares of peak demand savings were Home Energy Assessment (28%), Business Energy Rebates (19%), and Custom (17%).

As presented in Table 14 above, the Demand Reduction program, introduced in 2023, resulted in 8.091 MW in available demand response capacity in 2024.

## 5 Process Evaluation Results

For the 2024 evaluation, the Evaluator conducted four process evaluations for Affordable Multifamily Housing, Affordable Single-family Homes, Business Energy Rebates – Instant Rebates, and Custom New Construction.

### Affordable Multifamily Housing

To collect information on participant and distributor perspectives, the Evaluator conducted interviews with program staff, energy auditors (EAs), and participants.

The key findings specific to the Affordable Multifamily Housing process evaluation are outlined below:

› **The Evaluator surveyed high levels of satisfaction overall.**

All 10 interviewed participants said that they were highly satisfied with Affordable Multifamily Housing and “would definitely” recommend the program component to other housing providers or affordable multifamily residential building owners (Net Promoter Score of 100). Everyone agreed that AMH is simple to understand and easy to complete. EAs were also satisfied with Affordable Multifamily Housing overall, particularly with the selection of upgrades.

› **Incentive calculations can cause confusion among participants.**

Participants do not always realize that they must pay tax on overall project expenditures and that the program component only covers up to 80% of pre-tax costs. E1 provides verbal and written explanations to participants on how incentives are determined and is working on wording to make things clearer, but participants still have difficulty understanding how much rebate they will be granted and how the rebate is calculated. Furthermore, some participants believe that the estimated incentive for the upgrades presented in the preapproval report is the amount they will receive at the end of their project, although this amount can change based on whether all the proposed equipment is installed.

› **Some participants would benefit from project management support.**

Based on comments from E1, Energy Auditors (EAs) and participants, project management assistance, technical/maintenance support, and help finding contractors would be useful for participants. Without this assistance, project delays are said to occur. Not being able to find a contractor was also cited as a reason for withdrawing from the program component.

Some participants consider that having more information on the upgrades installed (many energy efficiency questions from participants concern heat pumps and insulation) and case studies would also be valuable.

› **Among EAs, satisfaction is low with the audit reporting templates.**

The audit reporting templates generate lower satisfaction levels among EAs, particularly the one for the initial audit. EAs consider that the templates are lengthy and awkward to fill out and would prefer them to be Excel-based rather than Word-based for more data entry flexibility.

› **Costs and lack of budget are barriers to participation.**

Financial barriers constitute the main reasons most interviewed dropped-out participants withdrew from the program component. The majority had no budget available for building maintenance and efficiency upgrades, a situation that was echoed among most interviewed non-participants and half of Affordable Multifamily Housing participants. Necessary repairs and upgrades are dealt with on an ad-hoc basis. Half of interviewed dropped-out participants also had issues with the operating agreement, specifically that the rental rates were too low (see the next finding below). In view of the constraints faced by many affordable multifamily housing providers, it is not surprising that participants choose co-funding and low-interest financing as tools and support that would be most helpful to them.

Less frequent mentions for withdrawing from Affordable Multifamily Housing included building ineligibility and the desired upgrades not being included (roof repairs, electrical panel upgrades).

› **Rental rates in the operating agreement cause division among dropped-out participants and non-participants.**

Opinions on the operating agreement among dropped-out participants and non-participants were polarized. Negative perceptions were due to the rental rates in the agreement being lower than what dropped-out participants and non-participants currently charge and were therefore a barrier to participation (see the next finding above). Modifications to the proposed rental rates (i.e. making them more in line with current market rates) were seen as critical in changing these negative perceptions about Affordable Multifamily Housing among dropped-out participants and non-participants. E1 regularly reviews rental rates to align with current market conditions.

› **Term lengths are not a significant problem.**

No participants, dropped-out participants, or non-participants expressed significant concern about Affordable Multifamily Housing term lengths. Reducing the agreement terms from 12 years to 10 years (for comprehensive projects) and from six years to five years (for prescriptive projects) had minimal impact on their opinions of the covenant. The Evaluator is therefore of the opinion that E1 does not need to revise the term lengths of the operating agreement.

## **Affordable Single-family Homes**

To collect information on program staff, partner, and participant perspectives, the Evaluator conducted surveys with participants as well as interviews with heat pump contractors, program staff, and delivery agents.

The key findings specific to the Affordable Single-family Homes process evaluation are outlined below:

› **Participants see the value of the program.**

The energy efficient retrofits installed at no cost through Affordable Single-family Homes are perceived by participants to be making their homes more comfortable and warmer in winter and less expensive to heat.

› **Overall satisfaction with Affordable Single-family Homes is high.**

Surveyed participants as well as interviewed DAs and heat pump contractors are generally satisfied with Affordable Single-family Homes. Participants consider it easy and worthwhile to participate and would highly recommend the program to others. Although DAs and contractors make suggestions for improvements to the program, they widely agree that it is worthwhile being involved.

› **Despite overall satisfaction, there are three irritants with the program component.**

Long wait times (participants, DAs, and heat pump contractors), insufficient program and product information (participants), and reporting processes and lack of user-friendly software tools (DAs and heat pump contractors) are causing some dissatisfaction. These are expanded upon below.

› **Long wait times cause discontent at various program stages and for various stakeholders.**

- › Modelled participants are particularly dissatisfied with the wait time between their enrollment in ASFH and the initial home energy assessment. DAs and heat pump contractors are dissatisfied with the time it takes E1 to approve proposed upgrades.
- › Additionally, heat pump contractors mention untimely responses from E1 to email enquiries, hindered by a perceived lack of direct access to a contact person or mailbox..
- › E1 is cognisant of dissatisfaction with wait times and have put strategies in place. They report that they have expanded the number of staff members and are catching up with the backlog. It should be noted that a mailbox for heat pump contractors is already available and E1 recently provided training to improve contractor knowledge about and engagement with Affordable Single-family Homes.

› **Participants would like more information to be provided about the program steps.**

Limited participant knowledge about Affordable Single-family Homes can cause participant confusion and frustration during the initial DA/contractor visit, particularly if participants are considering taking part in multiple programs (such as Affordable Single-family Homes and Oil to Heat Pump Program [OHPA]).

› **More product information would be helpful for participants.**

Some participants say they did not receive information about the products installed and some still have doubts about how to operate and maintain their new equipment (especially heat pumps) even though contractors report reviewing this with participants after installation. Note that most questions fielded by DAs and contractors concern heat pump usage. This situation could potentially create barriers to proper equipment use and affect energy savings.

› **Record keeping/reporting is time consuming.**

Having to use two platforms for filling out the required record keeping/reporting forms (CIS) and uploading documentation (SharePoint) is said to lead to repetitive data entry and unclear requirements for DAs and heat pump contractors. While SharePoint is considered to be an adequate file sharing tool, the CIS is said not to provide effective project management. Furthermore, DAs report many changes since the original training on processes and system use, which have never been formally communicated and lead to a lot of back and forth with E1 to resolve issues.

## Business Energy Rebates – Instant Rebates

To collect information on participant and distributor perspectives, the Evaluator conducted surveys with participants as well as interviews with distributors.

The key finding specific to the Business Energy Rebates – Instant Rebates process evaluation is outlined below:

- › **Overall satisfaction with BER Instant Rebates is high among both participants and distributors.**  
For Instant Rebates, average satisfaction ratings of 9.1 and 8.3 out of 10 were reported by participants and distributors respectively. Participants reported being very satisfied with the interaction and communication with distributors and with the rebate amounts (average ratings of 9.0). Distributors were highly satisfied with the service support and communications provided by E1 (average rating of 9.3) and were generally satisfied with rebate processing, tracking, and reporting (average rating of 8.4).

## Custom New Construction

To explore opportunities to expand service presence outside of the electrically heated MURB market, the Evaluator analyzed the tracking sheet, performed secondary research, conducted interviews with participants, modellers, and program staff, and carried out a jurisdictional scan. The Evaluator also reviewed the logic model.

The key findings specific to the Custom New Construction process evaluation are outlined below:

- › **The service has been more successful in reaching Multi-Unit Residential Buildings (MURBs) than non-MURBs.**  
MURBs have comprised the majority of New Construction projects since 2022, and MURBs made up 24 of the 27 completed projects in 2024. Analysis of Halifax Regional Municipality (HRM) building permits suggests that there is potential for the service to capture more non-MURB buildings. Architectural and engineering firms, together with design-build firms and government stakeholders are key influencers in the design and construction of large non-MURB projects.
- › **The service has a higher portion of projects inside the HRM, which is to be expected. Targeting a higher number of buildings outside the HRM may require a change in building size eligibility criteria.**

The HRM contains about half of the province's population, so a higher proportion of projects inside the HRM is expected given the density of the population in the city. In addition, building rules inside the HRM streamline permitting processes and encourage larger and faster-built buildings, whereas conditions outside the HRM are less favourable for larger buildings. The jurisdictional scan found some programs with smaller building size requirements (i.e. aligned with National Energy Code of Canada for Buildings [NECB] 2020 Part 9 buildings); such an approach could be considered by E1 if the program wishes to capture a higher proportion of projects outside the HRM.

- › **Participants are satisfied with the program overall, particularly in terms of E1's responsiveness, and are moderately satisfied with the value of the program for their business.**

E1's responsiveness and speed of application approval received the highest satisfaction ratings. Participants reported lower satisfaction on elements related to the value of the program given the time and costs requirements for builders, and the ability to estimate a return on investment associated with the program.

- 
- › **Non-participant modellers are aware of and somewhat familiar with New Construction service, including those that work on non-MURB projects.**

All three non-participant modellers interviewed work on buildings that would be eligible for New Construction (i.e. electrically heated and 15,000 square feet or larger). Only one of the three non-participant modellers said they had discussed the service with their clients.

- › **Decarbonization is a motivator for participating in New Construction service.**

Almost all participants answering questions about decarbonization (five out of six) reported that GHG emissions were important to their company and three said that it motivated them to participate in the service.

- › **Financial factors are the primary barriers for energy efficient new construction projects (higher costs of energy efficient measures, cost of energy modelling), as well as builder awareness and understanding of the benefits of energy efficient construction, and insufficient modeller participation in the service.**

These barriers appear to be consistent across both MURB and non-MURB markets.

- › **The share of modelling costs covered by the program's modelling incentive may be insufficient to motivate some builders.**

Both staff and modellers noted that modelling costs are increasing and that these costs can be a barrier, notably for smaller eligible projects. Further, 30% of projects hit the modelling cap in 2024, implying that for 3 out of 10 participants, the modelling incentive is not covering half their modelling costs. The jurisdictional scan indicated that several jurisdictions have higher modelling incentive offers (either in portion of costs covered or cap) than E1.

- › **The program component would benefit from additional supporting energy modellers.**

Historically one energy modeller supported most of the New Construction service projects. E1 has worked to bring in more modellers to the program and in 2024, five energy modellers participated in the program. Further efforts should be taken to ensure a diverse group of modellers are aware of and engaged in the program.

- › **The program component should prepare for the shift to NECB 2020 in Nova Scotia. Builders will need to adjust designs, plan for higher efficiency technologies and higher upfront costs, and work closely with energy modellers under the new code.**

Nova Scotia will phase in Tiers 1, 2, and 3 of NECB 2020 over 2025–2029. The jurisdictional scan noted three programs that have aligned with NECB 2020 code adopted in their province. Participants and modellers are mixed in terms of how the code could impact program participation. Three jurisdictions scanned (BC Hydro, New Brunswick Power, and Efficiency Manitoba) all do this.

- › **The logic model is out of date and does not sufficiently document the program barriers or the activities currently being undertaken by the program to address these barriers.**

The Evaluator found that the program's activities are aligned with the barriers identified in the evaluation. However, the logic model and theory of change do not reflect this and needs to be updated to capture the reality of the market barriers and program activities today.

## 6 Market Evaluation Results

For the 2024 evaluation, the Evaluator conducted two market evaluations. The first was for Efficient Product Installation and was focused on electrician-installed measures, and the second was for Business Energy Rebates – Instant Rebates and was focused on the BNI lighting market.

### Efficient Product Installation: Electrician-installed Measures

To identify opportunities for other measures that could be installed by electricians under the program component, the Evaluator performed a jurisdictional scan across 15 jurisdictions throughout Canada and the US.

- › **The jurisdictional scan revealed several appropriate products to be considered for the Efficient Product Installation electrician-installed measure offer.**

The 2024 jurisdictional scan allowed the Evaluator to identify several measures that would be appropriate for the electrician-installed measures offered through Efficient Product Installation, namely advanced heat recovery ventilator controls, bathroom fans, block heater timers, and heat reflector panels or rolls.

### Business Energy Rebates – Instant Rebates: BNI Lighting

To analyze the evolution of the BNI lighting market, the Evaluator completed a market characterization study to assess the state of the lighting market and review whether updates to any baselines for BNI lighting products should be recommended.

The key findings specific to the Business Energy Rebates – Instant Rebates market evaluation are outlined below.

- › **According to participating BER-IR distributors, the fixture market has been transformed to LED. Distributors indicate that non-LED options for fixtures are now rare, reporting that their entire stock of fixtures is LED.**  
Distributors reported that 100% of their stock was LED for linear and high-bay fixtures and 99% for outdoor fixtures. They reported that manufacturers no longer supply non-LED alternatives and that this market share would be stable even in the absence of E1 incentives.
- › **Most purchases rebated through BER-IR are for new construction or products at the end of their useful life, which validates the use of a replace-on-burnout baseline for this program component.**
- › **The market evaluation results indicate that the market practice for BNI fixtures is LED technology, indicating that an update to the baseline for fixtures sold through BER-IR is imminent.**
- › **The LED market practice baseline for BNI fixtures also applies to new construction projects incented through BER-AR.**
- › **Distributors reported that the majority of their fixture stock is either DLC Premium or DLC standard.**
- › **Distributors still carry a small percentage of non-LED lamps for a subset of customers. They forecast this share to diminish even more over the next two years as more fixtures are replaced with LEDs.**
- › **Lighting retrofit opportunities remain for early replacements and particularly in some subsectors where capital funding is limited, like institutional and government buildings and to a lesser extent property management companies.**
- › **Distributors report that control products continue to evolve.**
- › **There is an increase in multi-wattage and multi-voltage fixture products available on the market.**  
For these products, the tracked wattage may not necessarily be the wattage used for all applications.

## CONCLUSIONS AND RECOMMENDATIONS

---

Overall, 2024 evaluated net electrical energy savings and peak demand savings achieved in the E1 DSM portfolio were respectively 6.630 GWh and 3.536 MW above the values tracked by E1, while available DR capacity was 0.033 MW below E1 tracked values, as illustrated in Table 5 and Table 6 above.

The Evaluator did not make any cross-cutting recommendations for 2024. The Evaluator's recommendations on individual program components are outlined in individual reports as well as in Table 15 and Table 16 below.

**Table 15: 2024 Recommendations on Residential Program Components**

| No.                 | Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AMH – R1            | To further aid understanding, consider providing participants with case study examples of incentive calculations to show pre-tax costs and how incentive amounts may change based on supplier quotes and/or equipment installed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| AMH – R2            | Ensure that support and handholding are available for participants who may need help navigating the program component and finding various contractors. Make technical guides available, providing general advice to help participants through the program component.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| AMH – R3            | Investigate the possibility of improving the audit reporting templates to improve time efficiencies for EAs, for example by streamlining the reports as much as possible.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| AMH – R4            | In the early stages of participant engagement, ensure that participants are aware of the co-financing options listed in E1's agreement.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| ASFH – R1           | To assess progress with participant wait times, E1 could track wait times as well as program delivery satisfaction levels (e.g. in quarterly customer satisfaction surveys) throughout 2025 to determine how strategies are performing and make adjustments if necessary.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| ASFH – R2           | <p>Provide participants with more information about ASFH to help them understand program options, eligible measures, and participation steps by implementing the following:</p> <p>a) Investigate ways to inform participants about all ASFH options (eligible measures and program processes). Ensure that other options (i.e. OHPA) are clear and presented to participants verbally and through marketing materials.</p> <p>b) Review the application template for clarity and adapt it to confirm with participants to which program they are applying (i.e. ASFH, OHPA). Ensure that the information in the application is shared with DAs/contractors.</p> <p>c) Once the participant has submitted the application, clearly communicate (perhaps using a visual) the participant touchpoints that will occur along their journey (e.g. who will be contacting them, at what point, and what to expect).</p> |
| ASFH – R3           | Reinforce participant awareness of the Energy Solution Advisor's role as E1 program navigator to help participants better understand and navigate E1's programs (including ASFH).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| ASFH – R4           | To maximize energy savings, ensure that all participants receive the necessary information to operate and maintain the equipment installed in language that is easy to understand. Implement checklists for DAs and heat pump contractors if necessary.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| ASFH – R5           | Ensure that DAs/contractors provide a leave-behind so that participants know who to contact in case of questions or difficulties or to better understand how to operate and maintain their heat pump.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| ASFH – R6           | Look for opportunities to streamline record keeping/reporting processes to reduce the administrative burden for DAs and contractors, taking into account program tracking and evaluation needs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| ASFH – R7           | Update the DA/contractor training guides on the record keeping/reporting processes and use of the software tools to reflect current practices and offer regular training sessions to provide updates on any changes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| EPI – R1            | <p>To improve the smart thermostat installation rate, explore and implement strategies to reduce the number of participants disconnecting this product due to dissatisfaction.</p> <p>For example, follow-up calls could be conducted, installers could educate participants more on this product, or additional educational material on this product could be shared with participants.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Green Heat – R1     | In light of their very low savings and considering their low uptake, consider removing wood fireplace inserts and pellet fireplace inserts from the Green Heat offer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| HEA – R1            | In light of their very low savings and considering their low uptake, consider removing wood fireplace inserts and pellet fireplace inserts from the HEA offer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Residential DR – R1 | Gather and analyze the Eco Shift Pilot data again in 2025 to improve the unitary available DR capacity value accuracy and ensure it is consistent over multiple years.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

**Table 16: 2024 Recommendations on Business, Non-profit, and Institutional Program Components**

| No.                          | Recommendation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| BER – R1                     | Undertake additional research to further validate the market evaluation results to establish, no later than Q3, when the LED baseline for BER-IR LED fixtures should take effect. Research should focus on the potential risk of the fixture market rebounding from reducing or removing the Instant incentives in the Nova Scotia market.                                                                                                                                                                       |
| BER – R2                     | Review the eligibility criteria for LED lighting in new construction projects in BER-AR given evidence that LEDs are the baseline for this market.                                                                                                                                                                                                                                                                                                                                                               |
| BER – R3                     | In line with Recommendation #1, research should also investigate the efficiency level of an LED baseline for LED fixtures.                                                                                                                                                                                                                                                                                                                                                                                       |
| BER – R4                     | The current non-LED baseline for lamps should be maintained for BER-IR and reassessed in 2026. Given trends, E1 should plan for a baseline change starting in 2027.                                                                                                                                                                                                                                                                                                                                              |
| BER – R5                     | Plan for a shift in the product offer for LED fixtures from BER-IR to BER-AR to capture remaining retrofit opportunities once LED baseline is adopted for BER-IR.                                                                                                                                                                                                                                                                                                                                                |
| BER – R6                     | Focus efforts on BER-AR to target market laggards for early replacement retrofits of their lighting.                                                                                                                                                                                                                                                                                                                                                                                                             |
| BER – R7                     | A LED baseline should also be applied to the EUL of LED fixtures rebated through BER-AR and SBES to reflect the fact that existing fixtures would have been replaced with LED fixtures at the end of their life. The baseline should consider the proportion of projects targeted for early replacement versus replace on burn-out as well as an estimated remaining EUL.                                                                                                                                        |
| BER – R8                     | Analyze opportunities for increasing interest around controlled lighting products.                                                                                                                                                                                                                                                                                                                                                                                                                               |
| BER – R9                     | Ensure that multi-wattage products are identified in the tracking sheet and select the middle wattage (i.e. not the lowest or highest) as the tracked wattage.                                                                                                                                                                                                                                                                                                                                                   |
| Custom New Construction – R1 | Review the demand savings script used for projects modelled in eQuest to ensure accurate results and favour an approach that can be applied consistently across a variety of modelling software.                                                                                                                                                                                                                                                                                                                 |
| Custom New Construction – R2 | Amend section 7.10 of the New Construction program guide to require M&V for large industrial New Construction projects.                                                                                                                                                                                                                                                                                                                                                                                          |
| Custom New Construction – R3 | Investigate the impact of increasing modelling incentives (the share of modelling costs covered as well as the incentive cap) on the service.                                                                                                                                                                                                                                                                                                                                                                    |
| Custom New Construction – R4 | Endeavour to recruit new energy modellers through targeted outreach; modellers put a premium on networking opportunities with builders.                                                                                                                                                                                                                                                                                                                                                                          |
| Custom New Construction – R5 | Consider collaborating with educational institutions and professional associations for energy modelling to build a stronger pipeline of qualified and engaged energy modellers across Nova Scotia.                                                                                                                                                                                                                                                                                                               |
| Custom New Construction – R6 | The program should increase targeted outreach and educational activities for builders and energy modellers related to the code shift and its impacts, particularly those involving technologies (including electrification), costs, and energy efficiency improvements. By providing practical guidance on meeting new requirements and exceeding them with the program's support, the program can position itself as a valuable resource while increasing program awareness and encouraging more participation. |
| Custom New Construction – R7 | Review the program guidelines and update to align with NECB 2020, which will be adopted in April 2025.                                                                                                                                                                                                                                                                                                                                                                                                           |
| Custom New Construction – R8 | Investigate aligning implementation incentives with NECB 2020 Tiers. Such alignment would need to consider the phased-in adoption of NECB 2020 Tiers 1–3 over 2025-29.                                                                                                                                                                                                                                                                                                                                           |
| Custom New Construction – R9 | E1 should update the Custom New Construction logic model to document and address current barriers and update the theory of change to include all activities being carried out to address these barriers.                                                                                                                                                                                                                                                                                                         |
| BNI DR – R1                  | Update the BNI DR Baseline Considerations document to properly address all situations encountered through the project reviews. <ul style="list-style-type: none"> <li>› Clearly define how to identify building operating hours and when to set the available DR capacity to zero.</li> </ul>                                                                                                                                                                                                                    |

- 
- › Ensure that lookback windows are moved consistently across all similar events unless they are moved due to an abnormal load.
  - › Clearly state in the document that certain events may be excluded on a per-participant basis due to missing AMI metering data because of technical issues or events not being called for participants identified as morning-only or evening-only participants.
- 

|                    |                                                                                                                            |
|--------------------|----------------------------------------------------------------------------------------------------------------------------|
| <b>BNI DR – R2</b> | <b>In the next evaluation, continue to use project reviews to establish tracked and evaluated available DR capacities.</b> |
|--------------------|----------------------------------------------------------------------------------------------------------------------------|

## APPENDIX II

### Calculation of Margins of Error

This appendix presents some examples of how the Evaluator established the margins of error for participant surveys, adjustment ratios, installation rates, and free-ridership levels. For participant survey margins of error, the example is drawn from the 2024 Green Heat evaluation. For the adjustment ratio margins of error, the example is drawn from the 2024 Custom Retrofit Evaluation. For the free-ridership level margins of error, the example is drawn from the Efficient Product Installation (EPI) evaluation.

#### Survey Margins of Error

The 2024 Green Heat past participant survey margins of error were established by using the following formula that correspond to the margin of error calculation for a proportion (i.e. a value between 0% and 100%).

$$\text{Margin of Error } (e) = Z\alpha \times \sqrt{\frac{p \times (1 - p)}{n}} \times \sqrt{\frac{N - n}{N - 1}}$$

Where:

$Z\alpha$  is the coefficient used at a specific confidence level.

$p$  is the proportion (typically established conservatively at 0.50, which yields the maximum error).

$N$  is the population or, in this case, the total number of unique participants.

$n$  is the sample size.

The sample size for this example is 204 participants who installed a mini-split heat pump (MSHP) and that were sampled for a past participant survey. Therefore, assuming a confidence level of 90%, a  $Z\alpha$  coefficient of 1.645 is used as presented in Table 1.

**Table 1: Distribution of Coefficients  $t$**

| Sample size | Confidence Level |       |       |
|-------------|------------------|-------|-------|
|             | 95%              | 90%   | 80%   |
| 2           | 12.710           | 6.314 | 3.078 |
| 5           | 2.776            | 2.132 | 1.533 |
| 10          | 2.262            | 1.833 | 1.383 |
| 15          | 2.145            | 1.761 | 1.345 |
| 20          | 2.093            | 1.729 | 1.328 |
| 30          | 2.045            | 1.699 | 1.311 |
| 100         | 1.984            | 1.660 | 1.290 |
| $\infty^*$  | 1.960            | 1.645 | 1.282 |

\* Coefficient z corresponds to the value of coefficient t for an infinite sample size and is used for samples larger than 30.

By using the formula presented above and assuming a confidence level of 90%, a proportion of 0.50 and a total number of 1,132 participants who installed a MSHP for the period studied, the margin of error was established at 5.2%.

$$\text{Margin of Error} = 1.645 \times \sqrt{\frac{0.50 \times (1 - 0.50)}{204}} \times \sqrt{\frac{1,132 - 204}{1,132 - 1}} = 5.2\%$$

In 2024, this calculation was performed for all participant surveys.

## Adjustment Ratio Margins of Error – Stratified Sample

Below is a description of the steps followed to calculate the margins of error for adjustment ratios applied to electrical energy and peak demand savings based on the energy savings example from the 2024 Custom Retrofit evaluation.

### Calculation of the Weighted Average of Adjustment Ratios

In 2024, different types of projects were reviewed for Custom Retrofit; the example herein is for regular retrofit projects. For these projects, the Evaluator used a stratified sample. Therefore, the weighted average adjustment ratio was calculated by using the following formula.

$$\text{Weighted Average AR} = \frac{\sum_{i=1}^n (\text{Stratum Weight}_i \times \text{Tracked Energy Savings}_i)}{\sum_{i=1}^n (\text{Stratum Weight}_i \times \text{Revised Energy Savings}_i)} = 1.021$$

In this calculation,  $n$  is the number of reviewed measures (18) and  $i$  represents each individual evaluated project; the Evaluator established a weighted average adjustment ratio of 1.021. The stratum weight corresponds to the total population number of projects in the stratum in which each project is found divided by the number of projects in that stratum in the sample.

### Calculation of the Standard Error

Since the overall adjustment ratio is based on a stratified weighted average, the Evaluator also calculated a stratified weighted standard error of the adjustment ratio instead of a simple standard error. The following formula is taken from the Uniform Methods Project (UMP) Chapter 11<sup>1</sup> and is applicable to a ratio that is obtained from a stratified sample. First, we calculate the standard error on evaluated savings.

$$\text{Standard Error Evaluated Savings} = \sqrt{\sum_{h=1}^H \left( \frac{(N_h)^2}{n_h} \times \left( 1 - \frac{n_h}{N_h} \right) \times (S_h)^2 \times \frac{\mu_{all}}{\bar{x}_{all}} \right)} = 369,784$$

Where:

- ›  $H$  is the number of strata (4) and  $h$  represents each stratum.
- ›  $N_h$  is the number of projects in the population for a stratum.
- ›  $n_h$  is the number of projects in the sample for a stratum.

<sup>1</sup> Khawaja, M.S., Rushton, J. and Keeling, J., Chapter 11: Sample Design Cross-Cutting Protocol, The Uniform Methods Project: Methods for Determining Energy-Efficiency Savings for Specific Measures. Golden, CO; National Renewable Energy Laboratory. NREL/ SR-7A40-68567, 2017.

- ›  $S_h$  is an estimator for stratum weights calculated with the equation below.

$$(S_h)^2 = \sum_{i=1}^{n_h} \frac{(\text{Revised Energy Savings}_i - \text{Weighted Average AR} \times \text{Tracked Energy Savings}_i)^2}{n_h - 1}$$

- ›  $\mu_{all}$  is the average savings per project for the population.
- ›  $\bar{x}_{all}$  is the average savings per project for the sample while accounting for weights, as presented in the equation below.

$$\bar{x}_{all} = \frac{\sum_{i=1}^{n_h} (\text{Stratum Weight}_i \times \text{Tracked Energy Savings}_i)}{\sum_{i=1}^{n_h} (\text{Stratum Weight}_i)}$$

The weighted standard error for the adjustment ratio of energy savings for Custom Retrofit projects was established at 369,784.

### Calculation of the Margins of Error

The margin of error on the adjustment ratio of Custom Retrofit energy savings was established by using the following formula, which compares the error in evaluated savings divided by the evaluated savings to obtain a margin of error in percentage; this percentage represents the error on the adjustment ratio.

$$\text{Margin of Error AR} = \frac{\text{Standard Error Evaluated Savings} \times t}{\text{Tracked Energy Savings}_{all} \times \text{Weighted Average AR}} = \frac{369,784 \times 1.740}{12,762,154 \times 1.021} = 4.9\%$$

In this calculation, the coefficient  $t$  was calculated for a sample size of 18 at a level of confidence of 90%, which yields 1.740. By using the above formula, the margin of error for the adjustment ratio applied to the electrical energy savings generated by Custom Retrofit projects was established at 4.9%.

In 2024, this calculation was only performed for the adjustment ratios of Custom and BNI DR. Sometimes, such as for smaller measure categories or small programs (like Strategic Energy Management [SEM]), a census approach was used, meaning that all projects were reviewed and that calculating a margin of error on the adjustment ratio was unnecessary.

### Free-ridership Level Margin of Error

The Evaluator used the margin of error calculation of the free-ridership level for EPI LED lighting in 2024 as an example. Below are the steps followed to calculate this margin of error. The same calculation is used for installation rates and adjustment ratios for non-stratified samples, with the only difference being the use of installation rates or adjustment ratios instead of free-ridership levels in the equations.

### Calculation of the Weighted Average of Free-ridership Levels

The weighted average was calculated by using the following formula.

$$\text{Weighted Average FR} = \frac{\sum_{i=1}^n \text{Free-ridership Level}_i \times \text{Revised Gross Energy Savings}_i}{\text{Total Revised Gross Energy Savings}} = 16\%$$

In this calculation,  $n$  is the number of surveyed participants who installed LED lighting in 2024, and  $i$  represents each individual participant surveyed. The Evaluator established the weighted average free-ridership level at 16%.

## Calculation of the Standard Error

Since the free-ridership level is based on a weighted average, the Evaluator also calculated a weighted standard error of the free-ridership level instead of a simple standard error. The same formula as for the adjustment ratio standard error was applied, as follows.

$$\text{Standard Error FR} = \frac{1}{\sqrt{n}} \sqrt{\sum_{i=1}^n \left( \frac{(FR \text{ Savings}_i - \text{Weighted Average FR} \times \text{Revised Gross Savings}_i)^2}{(\text{Average Revised Gross Savings per Participant})^2 \times (n-1)} \right)} = 0.0193$$

In this calculation,  $n$  is the sample size (the number of surveyed participants) and  $FR \text{ Savings}_i$  is the free-ridership percentage measured for a given participant  $i$  multiplied by the gross savings of that participant. The average revised gross savings per participant is calculated for all participants who installed LED lighting in 2024 at the time of the survey.

## Calculation of the Margin of Error

The margin of error on the adjustment ratio of the EPI LED lighting free-ridership level was established by using the following formula that is the general equation linking the standard error to the margin of error.

$$\begin{aligned} \text{Margin of Error FR} &= \text{Standard Error FR} \times t \times \text{Finite Population Correction Factor} \\ &= \text{Standard Error} \times t \times \sqrt{\frac{N-n}{N-1}} = 0.0193 \times 1.667 \times \sqrt{\frac{5,342-70}{5,342-1}} = 3.2\% \end{aligned}$$

In this calculation,  $N$  represents the total number of participants at the time of the survey and who installed LED lighting in 2024, which was 5,342. The coefficient  $t$  was calculated for a sample size of 90 at a level of confidence of 90%, which yields 1.667. By using the above formula, the margin of error for the free-ridership level for EPI LED lighting was established at 3.2%.

In 2024, this calculation was performed for the free-ridership ratios of EPI, Instant Savings, BER Instant Rebates, and Custom. This calculation was also performed for EPI installation rates and AMH adjustment ratios.

## APPENDIX III

### NTGR Calculations

---

This appendix provides an example of net-to-gross ratio (NTGR) calculations. The example details the calculations of participant free-ridership levels and resulting NTGR for EPI LED Bulbs. The Evaluator used a similar approach in assessing the NTGR of other program components. More details can be found in the evaluation reports of individual program components.

## NTGR Calculations

| Free-ridership algorithm                                                                                                                                                                                                |                                                                                                 |        | Low Free-ridership Participant                              |       | High Free-ridership Participant                           |       | Medium Free-ridership Participant                         |       |

|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Accuracy</b>                           | Reflects the proximity of measurements to the true value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Adjustment ratio</b>                   | The ratio of evaluated results to tracked results. This ratio expresses the adjustment made to tracked savings or other tracked values such as effective useful life values.                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Available Demand Response Capacity</b> | The capacity that is available to Nova Scotia Power (NS Power) to reduce system peak demand. This capacity is calculated based on the first two hours of all events called between December and February, excluding weekends and holidays. If an event is shorter than two hours, only the first hour is used to measure available demand response (DR) capacity. Available DR capacity is evaluated on a per-participant basis based on the average demand reduction observed for each event in which the participant was scheduled to participate. E1's total available DR capacity is the sum of each participant's available DR capacity. |
| <b>Baseline</b>                           | To determine gross savings, a baseline (or base case) is established, providing detailed information about the reference (e.g. pre-existing or standard) measure or equipment chosen to be compared with the efficient measure or equipment. For the reference measure or equipment, the baseline may include such information as the hours of operation, wattage, and base consumption.                                                                                                                                                                                                                                                      |
| <b>Bias</b>                               | Systematic deviations of measurements from the true value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Billing calibration</b>                | An activity that consists of adjusting the expected energy savings based on the relative difference between the results of energy simulations and the actual energy consumption of a building or system.                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Confidence interval</b>                | The estimated range of values that is likely to include unknown population parameters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Demand response</b>                    | Demand response measures generate savings in the form of available capacity or a load reduction in response to events called by the electric utility (NS Power) to reduce the load at strategic moments. These events can be called at any time and for any duration, although they are usually called for one to four hours during peak periods.                                                                                                                                                                                                                                                                                             |
| <b>Displaced wattage</b>                  | The displaced wattage is defined as the difference between the wattage values of the baseline equipment or product and that of the efficient equipment or product.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>EnerGuide rating</b>                   | An EnerGuide (official brand of Natural Resources Canada) rating is a standard measure of home energy performance. It is a measure of the efficiency of the building only and does not take into account occupant behaviour. It shows how energy efficient a home is through modelled home heat losses based on several factors including building envelope characteristics, heated volume, heating systems, and air leakage.                                                                                                                                                                                                                 |
| <b>Effective useful life</b>              | The period a measure is expected to be in service and provide both electrical energy and peak demand savings. This value combines equipment life and measure persistence, which includes factors such as business turnover or early retirement.                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Equipment life</b>                     | The number of years installed equipment will operate before it fails.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

|                                         |                                                                                                                                                                                                                                                                                                                                 |
|-----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Equivalent CO2</b>                   | A unit of measurement indicating the amount of carbon dioxide to which various kinds of emitted greenhouse gases are equivalent in terms of warming effects. In this report, gas global warming potential is estimated over a timescale of 100 years.                                                                           |
| <b>Equivalent effective useful life</b> | The number of years by which the first-year savings estimate is multiplied to obtain lifetime energy savings. This value takes into account variations in annual electrical energy savings throughout the effective useful life due to increased baselines.                                                                     |
| <b>Evaluated savings</b>                | Gross and net electrical energy or peak demand savings calculated by the Evaluator using the parameters (unitary savings values, installation rates, interactive effects, net-to-gross ratios, etc.) validated or measured during the evaluation process. Unless otherwise specified, evaluated savings are first-year savings. |
| <b>Evaluation plan</b>                  | The evaluation plan summarizes the program description, objectives, base cases, documentation, evaluation methodology, budget, and schedule.                                                                                                                                                                                    |
| <b>First-year savings</b>               | The first full year of electrical energy or peak demand savings generated by an energy efficiency measure.                                                                                                                                                                                                                      |
| <b>Free-ridership</b>                   | Percentage of gross savings attributable to participants who would have implemented the same or similar energy efficiency measures, with no change in timing, in the absence of the program.                                                                                                                                    |
| <b>Gross savings</b>                    | Change in energy consumption and/or demand that results directly from program-related actions taken by participants in an energy efficiency program regardless of why they participated.                                                                                                                                        |
| <b>Induced consumption</b>              | Energy consumption of appliances that would have been unplugged and not replaced by participants in the absence of the program.                                                                                                                                                                                                 |
| <b>Interactive effects</b>              | Effects on the energy consumption of other systems (such as heating and cooling) in a building due to the installation of an energy efficiency measure.                                                                                                                                                                         |
| <b>In-service rate</b>                  | The proportion of incentivized products installed and operating. This rate is usually applied to programs through which rebates are offered in-store and products are likely to be stored for a certain period before being installed, such as light-emitting diode (LED) lamps.                                                |
| <b>Installation rate</b>                | The proportion of incentivized products reported as installed and that remain installed and operating at the time of evaluation. This rate is usually applied to direct install or mail-in rebate programs through which measures are expected to be installed immediately at the time of participation.                        |
| <b>Lifetime energy savings</b>          | The energy savings that occur over the lifetime of an energy efficiency measure. Lifetime energy savings account for a measure's effective useful life and any increase in the baseline efficiency level (which reduces attributable annual savings) over its lifetime.                                                         |
| <b>Line loss factor</b>                 | The multiplier to convert savings at the customer meter to savings at the utility generator. It accounts for the electrical losses of the transmission and distribution system.                                                                                                                                                 |
| <b>Margin of error</b>                  | The amount of random sampling error.                                                                                                                                                                                                                                                                                            |
| <b>Market effects</b>                   | The impact of a program on the market (in terms of product availability, practices, and prices) and that extends beyond changing program participant behaviours. Market effects include spillover among non-participants.                                                                                                       |

|                                 |                                                                                                                                                                                                                                                                                                                                                             |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Net savings</b>              | Electrical energy or peak demand savings that can be reliably attributed to a program. These include effects such as free-ridership and spillover that negatively or positively affect the savings attributable to a program.                                                                                                                               |
| <b>Net-to-gross ratio</b>       | The ratio of net electrical energy savings to gross electrical energy savings.                                                                                                                                                                                                                                                                              |
| <b>Non-sampling error</b>       | Errors arising during the course of all survey activities other than sampling. Non-sampling errors tend to lead to bias in measurements and are very difficult to quantify.                                                                                                                                                                                 |
| <b>Peak coincidence factor</b>  | The percentage of measure demand savings that coincide in time with the annual peak demand of the entire electricity system.                                                                                                                                                                                                                                |
| <b>Peak demand savings</b>      | The demand savings that coincide in time with the expected annual peak demand period of the entire electricity system. For industrial participants on an interruptible rate, peak demand savings may include savings on non-firm loads, i.e. loads that may be interrupted when NS Power's 10-minute reserve is low.                                        |
| <b>Precision</b>                | The extent to which repeated measurements agree with one another.                                                                                                                                                                                                                                                                                           |
| <b>Random sampling error</b>    | An error in measurement due to the fact that measurements are taken from a subset of the population and not the entire population.                                                                                                                                                                                                                          |
| <b>Realization rate</b>         | The ratio of evaluated savings to tracked savings.                                                                                                                                                                                                                                                                                                          |
| <b>Sample size</b>              | The number of observations or replicates included in a statistical sample.                                                                                                                                                                                                                                                                                  |
| <b>Secondary market impacts</b> | Energy consumption of appliances that would have been transferred to the secondary market if said appliances had not been retired.                                                                                                                                                                                                                          |
| <b>Spillover</b>                | Savings attributable to participants who implement additional energy efficiency measure(s) introduced by a program after participating in it once and without participating in the program a second time.                                                                                                                                                   |
| <b>Tracked savings</b>          | Gross and net savings calculated based on various parameters such as number of participants or units installed or sold, unitary savings values, installation rates, interactive effects, and net-to-gross ratios. Those parameters, with the exception of the number of participants or units installed or sold, are obtained from the previous evaluation. |
| <b>Unitary savings</b>          | Electrical energy or peak demand savings established on a unitary basis. A unit can either be a product (e.g. an 8 W LED lamp), a capacity (e.g. one tonne capacity of an air-source heat pump), or a participant (e.g. one participant taking part in a behaviour-based program).                                                                          |

## EXECUTIVE SUMMARY

This report presents the 2024 demand-side management (DSM) evaluation results of the Residential Efficient Product Rebates program administered by EfficiencyOne (E1). This program is comprised of two components: (1) Appliance Retirement (ARet) and (2) Instant Savings.

### Evaluation Approach

The 2024 evaluation was aimed at calculating program component gross and net results, namely electrical first-year and lifetime energy savings, peak demand savings, as well as avoided greenhouse gas (GHG) emissions. Table 1 summarizes the types of evaluation conducted for each program component and the corresponding methodology.

**Table 1: Summary of 2024 Residential Efficient Product Rebates Program Evaluation**

| Program Component    | Evaluation Type |         |        | Methodology                                                                                                                                                                                                                                                                                                                                |
|----------------------|-----------------|---------|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### Program Performance

Table 2 below presents the participation levels, NTGRs, evaluated gross and net savings at the generator, annual GHG emission reductions, as well as EUL values for each program component and for Residential Efficient Product Rebates as a whole.

**Table 2: Overall 2024 Residential Efficient Product Rebates Participation and Evaluated Savings**

|                                | Participation Level |               | Gross Savings |                  | NTGR  | Net Savings |                  |
|--------------------------------|---------------------|---------------|---------------|------------------|-------|-------------|------------------|
|                                | Value               | Unit          | Value         | Unit             | Value | Value       | Unit             |
| ARet                           |                     |               |               |                  |       |             |                  |
| Energy Savings                 | 5,941               | Appliances    | 4.195         | GWh              | 0.56  | 2.365       | GWh              |
| Lifetime Energy Savings        |                     |               | 16.729        | GWh              | 0.56  | 9.433       | GWh              |
| Peak Demand Savings            |                     |               | 0.598         | MW               | 0.56  | 0.337       | MW               |
| Annual GHG Emission Reductions |                     |               | 1,981         | Tonnes of CO2 eq | 0.56  | 1,117       | Tonnes of CO2 eq |
| EUL                            |                     |               | 4.0           | Years            |       | 4.0         | Years            |
| Instant Savings                |                     |               |               |                  |       |             |                  |
| Energy Savings                 | 395,472             | Products sold | 26.884        | GWh              | 0.83  | 22.252      | GWh              |
| Lifetime Energy Savings        |                     |               | 102.688       | GWh              | 0.95  | 97.841      | GWh              |
| Peak Demand Savings            |                     |               | 2.956         | MW               | 0.82  | 2.428       | MW               |
| Annual GHG Emission Reductions |                     |               | 12,695        | Tonnes of CO2 eq | 0.83  | 10,508      | Tonnes of CO2 eq |
| EUL                            |                     |               | 3.8           | Years            |       | 4.4         | Years            |
| Total                          |                     |               |               |                  |       |             |                  |
| Energy Savings                 |                     |               | 31.079        | GWh              | 0.79  | 24.617      | GWh              |
| Lifetime Energy Savings        |                     |               | 119.417       | GWh              | 0.90  | 107.274     | GWh              |
| Peak Demand Savings            |                     |               | 3.554         | MW               | 0.78  | 2.765       | MW               |
| Annual GHG Emission Reductions |                     |               | 14,676        | Tonnes of CO2 eq | 0.79  | 11,625      | Tonnes of CO2 eq |
| EUL                            |                     |               | 3.8           | Years            |       | 4.4         | Years            |

Residential Efficient Product Rebates was aimed at achieving 14.481 GWh in net electrical energy savings and 1.967 MW in net peak demand savings at the generator for 2024. The program exceeded the net electrical energy savings target by 70% and peak demand savings target by 41%, mostly driven by Instant Savings which remains the largest contributor to both total program net electrical energy and peak demand savings.

The following subsections present findings and recommendations at the program component level.

## ARet Findings and Recommendations

This subsection presents the key findings from the 2024 ARet evaluation. The Evaluator has no specific recommendation for ARet.

**2024 ARet-Finding:** ARet achieved both its net electrical energy savings and peak demand savings targets by 22% and 18% respectively.

**2024 ARet-Finding:** The evaluated net electrical energy savings and peak demand savings determined by the Evaluator were equal to and slightly lower than the net savings and peak demand savings tracked by E1 respectively.

**2024 ARet-Finding:** Program participation levels in 2024 increased by 39% compared to 2023, with refrigerator and freezer retirements remaining the largest drivers of participation and savings.

## Instant Savings Findings and Recommendations

This subsection presents the key findings from 2024 Instant Savings evaluation. The Evaluator has no specific recommendation for Instant Savings.

**2024 Instant Savings-Finding:** Instant Savings surpassed both its net electrical energy savings and peak demand savings targets by 77% and 45% respectively.

**2024 Instant Savings-Finding:** Program participation levels in 2024 increased by 82% compared to 2023 levels, likely driven by E1's Lights Out campaign, with ENERGY STAR® certified LED fixtures and ENERGY STAR certified non-A-type LED lamps being the largest drivers of participation.

**2024 Instant Savings-Finding:** Savings from products other than lighting increased in 2024 compared to 2023 levels, while most savings continued to come from LED lighting products.

**2024 Instant Savings-Finding:** The free-ridership level for both LED lamps and LED fixtures decreased in 2024 compared to 2023 levels.

**2024 Instant Savings-Finding:** The evaluated net electrical energy savings and net peak demand savings determined by the Evaluator were higher than the net savings tracked by E1.

## Program Tracked and Evaluated Savings

Table 3 below compares E1 tracked energy and peak demand savings to Evaluated savings at the generator. The realization rate and NTGR are also presented and correspond to the rounded averages obtained by dividing net savings by gross savings, which explains why the NTGR values are different from those presented in the other sections.

**Table 3: Comparison of 2024 Tracked and Evaluated Savings at the Generator**

|                                                                                                                                                                 |                       | Gross Savings |      | NTGR* | Net Savings |      | Realization Rate |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------|---------------|------|-------|-------------|------|------------------|
|                                                                                                                                                                 |                       | Value         | Unit |       | Value       | Unit |                  |
| ARet                                                                                                                                                            | Energy Savings        |               |      |       |             |      |                  |
|                                                                                                                                                                 | Tracked Savings by E1 | 4.212         | GWh  | 0.56  | 2.374       | GWh  | 100%             |
|                                                                                                                                                                 | Evaluation Results    | 4.195         | GWh  | 0.56  | 2.365       | GWh  |                  |
|                                                                                                                                                                 | Peak Demand Savings   |               |      |       |             |      |                  |
|                                                                                                                                                                 | Tracked Savings by E1 | 0.602         | MW   | 0.56  | 0.339       | MW   | 99%              |
|                                                                                                                                                                 | Evaluation Results    | 0.598         | MW   | 0.56  | 0.337       | MW   |                  |
| Instant Savings                                                                                                                                                 | Energy Savings        |               |      |       |             |      |                  |

|                                                                                                                                                                 | Peak Demand Savings   |               |      |       |             |      |                  |
|                                                                                                                                                                 | Tracked Savings by E1 | 3.585         | MW   | 0.62  | 2.206       | MW   | 110%             |
|                                                                                                                                                                 | Evaluation Results    | 2.956         | MW   | 0.82  | 2.428       | MW   |                  |
| *NTGRs vary for each type of appliance. The NTGRs presented in this table correspond to the rounded averages obtained by dividing net savings by gross savings. |                       |               |      |       |             |      |                  |

## INTRODUCTION

EfficiencyOne (E1), an independent, non-profit organization, is responsible for helping Nova Scotians improve the energy efficiency of their homes and workplaces by designing, marketing, and delivering demand-side management (DSM) for Nova Scotians. E1 provides energy efficiency, demand response, and carbon mitigation services through the Efficiency Nova Scotia (ENS) franchise. Regulatory oversight of its DSM activities is provided by the Nova Scotia Utility and Review Board (NSUARB). E1 receives funding for its electricity demand-side management (DSM) activities from Nova Scotia Power (NS Power) ratepayers.

E1 has a DSM portfolio of three residential programs, three business, non-profit, and institutional (BNI) programs, and one demand response (DR) program that are marketed to Nova Scotians through the Efficiency Nova Scotia (ENS) franchise. Each program has one or more program components. Econoler was commissioned by E1 to evaluate E1's 2024 DSM program portfolio.

This evaluation report relates to the Residential Efficient Product Rebates program comprised of two components: Appliance Retirement (ARet) and Instant Savings. Table 4 below lists the Residential Efficient Product Rebates program components and the types of evaluations conducted for 2024. A comprehensive impact evaluation involves reviewing the following four key elements: (1) The baseline definition; (2) the savings calculation methodology; (3) the values of the parameters used to calculate savings; and (4) net-to-gross ratios (NTGRs). A condensed impact evaluation involves using some or all of the previous year's impact evaluation parameters such as unitary savings values, adjustment ratios, installation rates, and NTGRs to provide evaluated results.

**Table 4: Types of Evaluation Conducted for Each Program Component, 2024**

| Program                               | Program Component | 2024    |        |               |
|---------------------------------------|-------------------|---------|--------|---------------|
|                                       |                   | Process | Market | Impact        |
| Residential Efficient Product Rebates | ARet              |         |        | Condensed     |
|                                       | Instant Savings   |         |        | Comprehensive |

For each program, the Evaluator prepared a DSM evaluation report presenting key findings, electrical first-year and lifetime electrical energy savings, peak demand savings, and avoided greenhouse gas (GHG) emissions.<sup>1</sup>

<sup>1</sup> Unless specified otherwise, electrical energy savings refer to first-year savings rather than lifetime savings throughout this report.

# 1 ARet Overview

This section describes the Appliance Retirement (ARet) program component, follows up on past evaluation recommendations, and provides an overview of participation history.

## 1.1 ARet Description

Through ARet, E1 promotes the retirement of old, inefficient household appliances such as refrigerators, freezers, room air conditioners, and dehumidifiers. ARet educates Nova Scotians about the cost of maintaining old and inefficient appliances, provides free appliance pick-ups from homes, and offers financial incentives for appliance retirements.

In addition to removing old appliances from participants' homes, ARet transports them to a local recycling depot where over 95% of components are decommissioned and responsibly recycled. ARCA Canada Inc. (ARCA) is the delivery agent (DA) responsible for appliance collection, transportation, decommissioning, and recycling. To have appliances picked up, participants must call a toll-free number or register online using the booking portal available on the E1 website, both of which are managed by the DA. All website bookings, scheduling, and maintenance activities are the responsibility of the DA. Figure 1 outlines the main steps of the ARet participation process.

**Figure 1: ARet Participation Process Summary**

Eligible appliances must be in working condition and be 10 years of age or older. In 2024, this meant that eligible appliances had to be manufactured before 2014. In addition, full-sized refrigerators must have a standard size between 10 and 25 cubic feet, while full-sized freezers must be between seven and 25 cubic feet. For cost effectiveness, room air conditioners as well as small refrigerators and freezers are only picked up when a participant retires a full-sized refrigerator or full-sized freezer at the same time. To participate in ARet, participants must own the appliance(s) to be retired.

The following rebates are offered through ARet:

- › \$50 for each retired full-sized refrigerator<sup>2</sup>
- › \$50 for each retired full-sized freezer<sup>3</sup>
- › \$10 for each retired room air conditioner
- › \$10 for each retired small refrigerator or freezer

ARet was aimed at achieving 1.937 GWh in net electrical energy savings and 0.287 MW in net peak demand savings at the generator in 2024.

## 1.2 Follow-up on Past Evaluation Report Recommendations

No recommendations were made for ARet in the 2023 evaluation.

## 1.3 Participation History

Since 2012, ARet has retired or replaced a total of 77,696 old and inefficient appliances from homes and schools. These were recycled so that they could not be refurbished, sold second hand, or left plugged in.

In 2024, 5,941 appliances were retired through ARet as outlined in Figure 2 below. Specifically, a total of 3,763 refrigerators, 1,756 freezers, 257 air-conditioning units, and 165 small refrigerators or freezers were retired. No dehumidifiers were retired in 2024.

In 2024, 39% more appliance retirements were recorded compared to 2023 results. This increase was due to higher participation following two consecutive years of decreases. The increase was observed across all categories.

Figure 3 further below provides an overview of the evolution of ARet gross energy and peak demand savings from 2012 to 2024. The 2024 results represent increases of 39% in both gross energy and peak demand savings compared to 2023 levels.

---

<sup>2</sup> Incentives for full-sized refrigerators and freezers were increased from \$30 to \$50 in July 2021 to increase participation.

<sup>3</sup> Ibid.

**Figure 2: Overview of ARet Participation, 2012-2024**

**Figure 3: Evolution of ARet Gross Savings, 2012-2024**

## 2 ARet Evaluation Approach

The 2024 ARet evaluation involved a condensed impact evaluation. The main objectives were as follows:

- › Calculate gross and net results, namely electrical first-year and lifetime electrical energy savings, peak demand savings, as well as avoided GHG emissions

The Evaluator identified key research questions aimed at achieving the above objectives. Table 5 outlines the evaluation objectives and maps them to the research questions and methods established by the Evaluator. Each method is described further below.

**Table 5: 2024 ARet Evaluation Approach**

| Evaluation Objectives   | Research Questions                                                                                                                                                                                                                 | Methodology                                                                                                                                                              |

### Tracking Sheet Audit

Prior to performing a unitary savings review, the Evaluator performed an audit of the final 2024 tracking sheet to ensure it was complete and the entered data were consistent. The detailed protocol used for the tracking sheet audit and the results obtained are presented in Appendix I.

### Unitary Savings Review

As part of a major update to the 2024-2025 Demand-side Management Measure Assessment (DSM MA),<sup>4</sup> a unitary savings review was conducted for all measures. The unitary savings review entailed a literature review of technical reference manuals, metering studies, and program evaluations to determine if there were more appropriate methodologies or parameters to be applied to calculate energy and peak demand unitary savings. The Evaluator also reviewed the unitary savings values of refrigerators and freezers to account for the evolving mix of manufacture year-class and average unit size.

### Calculations Using Evaluation Results

The Evaluator calculated the first-year and lifetime energy and peak demand savings as per the calculation methodology presented in Section 3 below.

<sup>4</sup> The 2024-2025 DSM MA is a reference document that provides an in-depth review of all parameters necessary to calculate the annual and lifetime gross energy and peak demand savings of most prescriptive measures and some semi-prescriptive measures offered through E1's DSM program portfolio. In addition, the Measure Assessment includes effective useful life values for all measures offered in E1's program portfolio. For the evaluations conducted during the last two years of the 2023-2025 DSM cycle, the Evaluator refers to the values presented in the 2024-2025 DSM MA.

## GHG Emission Reduction Calculations

To obtain net avoided GHG emissions in CO<sub>2</sub> eq for ARet, the Evaluator multiplied the net energy savings by the latest Nova Scotia-specific factor for GHG emissions generated by electricity production. This factor was established using Nova Scotia Power (NS Power) data.

## 3 ARet Impact Evaluation

This section presents the findings of the 2024 condensed impact evaluation aimed at determining gross and net electrical energy and peak demand savings.

### 3.1 Tracking Sheet Audit

To ensure program results were reliably compiled, the Evaluator first performed a tracking sheet audit aimed at verifying the completeness and consistency of the data submitted by E1 as well as correcting the tracked savings as needed. The results are provided in Appendix I. The tracked savings results presented in this report therefore refer to the corrected tracked savings obtained by the Evaluator.

### 3.2 Gross Savings

For ARet, gross savings correspond to the change in energy consumption resulting from the retirement of energy inefficient appliances in participants' homes regardless of both why they participated and what they would have done if the program had not been available.<sup>5</sup>

As part of the 2024-2025 DSM MA update, the Evaluator revised the unitary savings values for freezer and refrigerator retirements based on both updated annual consumption and the proportion of units per manufacture-year class and average unit size found in the 2024 ARet tracking sheet. The unitary savings value for air conditioners was also updated with an updated energy efficiency ratio (EER), while values from the 2022 evaluation were used for dehumidifiers.

Detailed descriptions of the unitary savings calculations are presented in the 2024-2025 DSM MA.

#### 3.2.1 Unitary Energy Savings

Table 6 below presents the tracked and evaluated energy savings for each type of appliance retired through ARet for which a change in unitary savings was made in 2024 compared to 2023.

For full-sized and small refrigerator as well as full-sized and small freezer retirements, the variations in unitary savings values are due to changes in characteristics, namely age and size, of the appliances retired in 2024.

**Table 6: 2024 ARet Tracked and Evaluated Unitary Energy Savings**

| Appliance           | Tracked Unitary Energy Savings<br>[kWh/year] | Evaluated Unitary Energy Savings<br>[kWh/year] | Difference<br>(%) |
|---------------------|----------------------------------------------|------------------------------------------------|-------------------|
| <b>ARet</b>         |                                              |                                                |                   |
| Refrigerators       | 654                                          | 660                                            | 1%                |
| Freezers            | 752                                          | 726                                            | -3%               |
| Air Conditioners    | 164                                          | 184                                            | 12%               |
| Small Refrigerators | 164                                          | 164                                            | 0%                |
| Small Freezers      | 176                                          | 230                                            | 31%               |

<sup>5</sup> Definition adapted from: National Renewable Energy Laboratory, The Uniform Methods Project Chapter 23: Estimating Net Savings: Common Practices, September 2014, p. 3.

### 3.2.2 Peak Demand Savings

Peak demand savings correspond to the demand savings that coincide in time with the peak demand period of the electricity system. The projected electricity peak demand period in Nova Scotia is between 5 p.m. and 7 p.m. in the months of December to February on non-holiday weekdays. The detailed unitary peak demand savings calculations are presented in the 2024-2025 DSM MA.

Table 7 below lists the tracked and evaluated unitary peak demand savings for each category of appliance retired through ARet for which a change in unitary savings was made in 2024 compared to 2023. Although the Evaluator used the same peak demand-to-energy ratio as in previous years, there are variations in unitary peak demand savings because the Evaluator made changes to the unitary energy savings values as presented in Subsection 3.2.1 above.

**Table 7: 2024 ARet Tracked and Evaluated Unitary Peak Demand Savings**

| Appliance           | Tracked Unitary Peak Demand Savings [W] | Evaluated Unitary Peak Demand Savings [W] | Difference (%) |
|---------------------|-----------------------------------------|-------------------------------------------|----------------|
| <b>ARet</b>         |                                         |                                           |                |
| Refrigerators       | 90.3                                    | 91.1                                      | 1%             |
| Freezers            | 103.8                                   | 100.0                                     | -4%            |
| Small Refrigerators | 22.6                                    | 22.6                                      | 0%             |
| Small Freezers      | 24.3                                    | 31.7                                      | 30%            |

### 3.2.3 Interactive Effects

Interactive effects occur when an implemented energy efficiency measure has an impact on the energy consumption of other elements such as heating and cooling equipment. For ARet, retiring old appliances causes an increase in the heating load in winter and a decrease in the cooling load in summer since the compressor of the old appliance releases significantly more waste heat than a newer and more efficient model. If an inefficient appliance is retired without being replaced, interactive effects are greater.

The heating period in Nova Scotia lasts about eight months, while the cooling period is short and lasts approximately two months. Total annual interactive effects due to the retirement of old appliances are therefore expected to be negative, pushing the savings generated by such retirements downward.

Other factors can also affect the interactive effects caused through the program component, including:

- › The focus of the 2024 ARet evaluation was on electricity savings. In Nova Scotia, 53% of households use electricity as their primary heating source.<sup>6</sup> Therefore, the negative interactive effects on the heating load only affect approximately one-half of participating households.
- › Many appliances retired through ARet, such as refrigerators and freezers, are built into or leaned against an exterior wall. Rather than contributing to building heating loads, this results in more heat loss through the building envelope and through the appliance back side, thereby reducing interactive effects.
- › In Nova Scotia, slightly more than one-third of households (43%)<sup>7</sup> use air conditioning. For those households, positive interactive effects occur during the cooling period, which cancel a portion of the negative interactive effects.

<sup>6</sup> Statistics Canada, Residential Sector, Nova Scotia, Table 14: Total Households by Building Type and Energy Source, <https://oee.nrcan.gc.ca/corporate/statistics/neud/dpa/showTable.cfm?type=CP&sector=res&juris=ns&year=2020&rn=14&page=0> (last accessed December 11, 2024).

<sup>7</sup> Statistics Canada, Table 38-10-0019-01 – Air conditioners, <https://www150.statcan.gc.ca/t1/tbl1/en/cv.action?pid=3810001901> (last accessed December 12, 2024).

After carefully considering all these factors and noting that most jurisdictions that offer refrigerator and freezer retirement or replacement programs do not consider interactive effects for those appliance types,<sup>8</sup> the Evaluator concluded that ARet interactive effects were negligible and therefore established the interactive effects factor at 0%.

### 3.2.4 Effective Useful Life

Effective useful life (EUL) values are used in the calculations of electrical energy savings that are expected to persist over time. For ARet, the lifetime energy savings and equivalent EUL values are highly influenced by the remaining useful life (RUL) of old units; the latter corresponds to the remaining time that the old appliance would still have been used if it had not been retired.

For the 2024 evaluation, the Evaluator relied on the EUL values presented in the 2024-2025 DSM MA. Table 8 below summarizes the equivalent EUL values for each type of appliance. The equivalent EUL values were applied to the gross and net first-year energy savings of each appliance to obtain gross and net lifetime energy savings (see Subsections 3.2.5 and 3.3.4 below). The weighted average EUL value is 4.0 years.

**Table 8: 2024 ARet Equivalent EUL and Gross Lifetime Unitary Savings Values**

| Appliance           | Tracked Equivalent EUL [years] | Evaluated Equivalent EUL [years] | Evaluated Gross Lifetime Unitary Savings [kWh] |
|---------------------|--------------------------------|----------------------------------|------------------------------------------------|
| <b>ARet</b>         |                                |                                  |                                                |
| Refrigerators       | 4                              | No change                        | 2,640                                          |
| Freezers            | 4                              | No change                        | 2,904                                          |
| Air Conditioners    | 3                              | No change                        | 552                                            |
| Small Refrigerators | 4                              | No change                        | 656                                            |
| Small Freezers      | 4                              | No change                        | 920                                            |

### 3.2.5 Evaluated Gross Savings

The gross energy and peak demand savings resulting from the retirement of appliances through ARet are listed in Table 9 below.

Line loss factors correspond to the values submitted to the Nova Scotia Utility and Review Board (NSUARB) as part of the 2014 Cost of Service Study Progress Update.<sup>9</sup> The proportions of residential participants versus that of commercial participants were calculated using 2024 ARet tracking sheet data. For appliances retired through ARet, gross energy savings at the generator were estimated by using a line loss factor of 0.0947 kW, while peak demand savings were estimated using a line loss factor of 0.1439 kW.<sup>10</sup>

<sup>8</sup> The technical reference manuals (TRMs) for California municipal utilities, Connecticut, Illinois, Maine, Massachusetts, Minnesota, Mid-Atlantic, New York, Northwest Power and Conservation Council, Ohio, Pennsylvania, Vermont, and Wisconsin were consulted. Only Northwest Power and Conservation Council and New York apply interactive effect factors for freezers and refrigerators (although only for new rebated appliances and not for recycled appliances).

<sup>9</sup> Nova Scotia Utility and Review Board, Matter M06555, 2014 Cost of Service Study Progress Update, Exhibit N-2.09, Appendix I1.

<sup>10</sup> For municipal utility participants, the line loss factor of the most similar NS Power rate code was assumed.

**Table 9: Evaluated 2024 ARet Gross Energy and Peak Demand Savings**

| Measure Category                                              | Appliance Retirement |              |                       |                     |                |               |

Figure 4 below compares the tracked and evaluated gross electrical energy savings, while Figure 5 further below compares the tracked and evaluated gross peak demand energy savings. The two measures generating the majority of first-year electrical energy savings were refrigerator retirements (65%) and freezer retirements (33%).

**Figure 4: 2024 Tracked and Evaluated Gross Electrical Energy Savings at the Generator**

**Figure 5: 2024 Tracked and Evaluated Gross Peak Demand Savings at the Generator**

As presented in Table 10, gross GHG emission reductions were calculated by applying the Nova Scotia-specific factor<sup>11</sup> for GHG emissions generated by electricity production to ARet gross savings.

**Table 10: Evaluated 2024 ARet Gross GHG Emission Reductions**

|                                                                                            | Total        |

### 3.3 Net Savings

The Evaluator determined the net energy and peak demand savings, that is the electrical energy and peak demand savings that can be reliably attributed to the program component, by establishing a NTGR for each appliance type. For ARet, the NTGRs were established by considering the free-ridership and secondary market impacts that negatively affect energy savings as well as spillover that positively affects energy savings.

For appliance retirements, the NTGR assessment was based on a methodology that complies with the general guidelines of the Uniform Methods Project (UMP) for refrigerator recycling evaluations.<sup>12</sup> This methodology involves considering the full energy consumption of retired appliances as gross unitary energy savings; then, net savings (without spillover) are obtained by deducting the energy impacts from free-ridership and secondary market scenarios. From these results, average free-ridership levels (including secondary market impacts) are calculated, while spillover is determined by calculating the energy impacts of all appliance retirements influenced by the program component but not achieved through the latter as a percentage of ARet gross energy savings.

#### 3.3.1 Free-ridership and Secondary Market Impacts

For appliance retirements, free-ridership corresponds to the energy consumption of appliances that would have been disposed of in the absence of the program, and secondary market impacts correspond to the consumption of those appliances that would have been transferred to other owners.

Since no data collection was conducted in 2024, the 2022 free-ridership and secondary market impact levels were used for full-sized refrigerators and freezers. These levels were assessed during the 2022 evaluation using a self-reporting approach consisting of a participant telephone survey. Participants were asked questions to assess the likelihood that their appliance would have been kept, transferred, or destroyed in the absence of ARet.<sup>13</sup> The participation levels for the retirement of other appliance types were too low to reliably assess free-ridership using the 2022 survey; thus, for air conditioners and small appliances, the free-ridership levels from the 2018 evaluation were used.

<sup>11</sup> At the time of writing, 2024 data were not yet available. The Nova Scotia-specific factor was obtained from Nova Scotia Power's 2023 total system emissions data (4,931,152 CO2 eq tonnes) and total electricity generation (10,442 GWh) was drawn from the following two sources: Nova Scotia Power, Total System Emissions, <https://www.nspower.ca/clean-energy/air-emissions-reporting> (last accessed September 27, 2024) and Emera Inc., Emera Inc. 2023 Annual Report, p. 31, available at [https://s25.q4cdn.com/978989322/files/doc\\_financials/2023/ar/Emera\\_2023\\_AR\\_FINAL.pdf](https://s25.q4cdn.com/978989322/files/doc_financials/2023/ar/Emera_2023_AR_FINAL.pdf) (last accessed September 27, 2024).

<sup>12</sup> NREL, The Uniform Methods Project: Methods for Determining Energy Efficiency Savings for Specific Measures. Chapter 7: Refrigerator Recycling Evaluation Protocol, prepared by the Cadmus Group, September 2017.

<sup>13</sup> Data for the discard scenario proportions for freezer retirements were not collected in 2022; therefore 2018 data were used. For further details on how the discard scenario proportions are incorporated into the free-ridership calculation, please refer to Appendix VI.

The average free-ridership levels and secondary market impacts are presented in Table 11 for each appliance type.

**Table 11: 2024 ARet Free-ridership Levels**

| Appliance Type      | Free-ridership<br>(with Secondary Market Impacts) |                 |
|---------------------|---------------------------------------------------|-----------------|
|                     | Level                                             | Margin of Error |
| Refrigerators       | 43%                                               | 6.3%            |
| Freezers            | 45%                                               | 5.5%            |
| Air Conditioners    | 47%                                               | 13.0%           |
| Small Refrigerators | 32%                                               | 10.3%           |
| Small Freezers      | 32%                                               | 10.3%           |
| Dehumidifiers       | 0%                                                | N/A             |

### 3.3.2 Participant Spillover

Appliance retirements may have occurred due to the influence of ARet even if no application was submitted. This influence can be due to a number of factors such as better awareness about the energy impacts from keeping the appliances. These retirements should be attributed to the program component as a form of spillover.

The methodology used to calculate spillover consists of estimating the energy impacts as a percentage of ARet gross energy savings for all appliance retirements influenced by the program component but not made through it.

There was no change in spillover since the last evaluation for ARet; hence, the spillover level was still considered to be nil.

### 3.3.3 Net-to-gross Ratio Calculation

NTGR values were calculated using the following equation.

$$NTGR = (1 - \% \text{ Free-ridership} + \% \text{ Spillover})$$

Using the average free-ridership levels established for each appliance type, the Evaluator calculated corresponding NTGR values, the results of which are presented in Table 12.

**Table 12: 2024 ARet Effects and NTGR**

| Appliance Type      | Average Free-ridership<br>(with Secondary Market Impacts) | Spillover | NTGR        |
|---------------------|-----------------------------------------------------------|-----------|-------------|
| Refrigerators       | 43%                                                       | 0%        | <b>0.57</b> |
| Freezers            | 45%                                                       |           | <b>0.55</b> |
| Air Conditioners    | 47%                                                       |           | <b>0.53</b> |
| Small Refrigerators | 32%                                                       |           | <b>0.68</b> |
| Small Freezers      | 32%                                                       |           | <b>0.68</b> |
| Dehumidifiers       | 0%                                                        |           | <b>1.00</b> |

### 3.3.4 Evaluated Net Savings

Net savings represent the savings that can be reliably attributed to a program component. For ARet, net savings are calculated by applying the NTGR values to gross savings as illustrated in the following equation:

$$\text{Net Savings} = \text{Gross Savings} \times \text{NTGR}$$

The detailed savings results are outlined in Table 13 below. The net energy savings resulted in 1,117 tonnes of CO<sub>2</sub> eq in net annual GHG emission reductions.

**Table 13: Evaluated 2024 ARet Net Energy and Peak Demand Savings**

| Measure Category                                            | Appliance Retirement |              |                       |                     |                |              |

As outlined in Figure 6, ARet exceeded both its electrical energy and peak demand savings targets by 22% and 18% respectively.

**Figure 6: 2024 ARet Targets and Evaluated Savings**

### 3.4 Realization Rate

Table 14 below compares ARet total tracked and evaluated savings. It also includes the realization rate, representing the ratio of evaluated net savings to tracked net savings, for both energy savings and peak demand savings.

**Table 14: Comparison of 2024 ARet Tracked and Evaluated Savings at the Generator**

|                                                                                                                                                                 | Gross Savings |      | NTGR* | Net Savings |      | Realization Rate |

| *NTGRs vary for each type of appliance. The NTGRs presented in this table correspond to the rounded averages obtained by dividing net savings by gross savings. |               |      |       |             |      |                  |

Although unitary savings values were updated for all measures, the evaluated net energy and peak demand savings were both less than 1% below the values tracked by E1.

## 4 ARet Key Findings and Recommendations

The 2024 ARet evaluation included a condensed impact evaluation, and its main objectives were as follows:

- › Calculate gross and net ARet results, namely electrical first-year and lifetime energy savings, peak demand savings, as well as avoided GHG emissions

This section provides the Evaluator's key findings in relation to the above objectives. The Evaluator has no specific recommendation for ARet.

**2024 ARet-Finding: ARet achieved both its net electrical energy savings and peak demand savings targets by 22% and 18% respectively.**

ARet achieved 2.365 GWh in net electrical energy savings and 0.337 MW in net peak demand savings at the generator in 2024, thus surpassing the planned net electrical energy savings and net peak demand savings of 1.937 GWh and 0.287 MW respectively.

**2024 ARet-Finding: The evaluated net electrical energy savings and peak demand savings determined by the Evaluator were equal to and slightly lower than the net savings tracked by E1 respectively.**

Although unitary savings values were updated for all measures, the evaluated net energy and peak demand savings were both less than 1% below the values tracked by E1.

**2024 ARet-Finding: Program participation levels in 2024 increased by 39% compared to 2023 levels, with refrigerator and freezer retirements remaining the largest drivers of participation and savings.**

Full-sized refrigerators and freezers continue to be the largest contributors to participation and savings for the program component, generating 98% of 2024 savings. After two consecutive decreases in 2022 and 2023, participation levels increased by 39% in 2024.

## 5 Instant Savings Overview

This section describes Instant Savings, follows up on past evaluation recommendations, and provides an overview of participation history.

### 5.1 Instant Savings Description

Instant Savings offers instant cash rebates to consumers who purchase eligible energy efficient products. Instant Savings is delivered with the help of one Delivery Agent (DA), Summerhill Group Inc., as well as national and independent retailers that offer instant rebates on energy efficient products at over 150 locations across Nova Scotia. To respond to online shopping trends, E1 introduced online retailers to their list of participating retailers in 2019 and online purchasing of select products directly from manufacturers in 2020.

Rebates on eligible products were offered during the following periods:

- › Spring campaign from March 22 to May 19, 2024
- › Fall campaign from September 23 to November 17, 2024
- › Year-round on selected products from January 1 to December 31, 2024

Table 15 below summarizes the energy efficient products offered through Instant Savings and their respective rebate amount. For each product category, a list of eligible stock keeping units (SKUs) for each retail partner is maintained and approved by E1.

**Table 15: List of 2024 Rebates by Product**

| Products Offered During Campaigns                                                                                                                                                                                            | Rebate During Spring Campaign                 | Rebate During Fall Campaign               |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------|-------------------------------------------|
| ENERGY STAR® Certified LED Lights Non-A-series (single & multipacks)                                                                                                                                                         | Up to 70% off package price*                  | Up to 80% off package price*              |
| ENERGY STAR Certified LED Recessed Downlight Fixtures (single & multipacks)                                                                                                                                                  | Up to 70% off package price*                  | Up to 80% off package price*              |
| ENERGY STAR Certified LED Fixtures Without Motion Sensors                                                                                                                                                                    | Up to 70% off package price (up to \$25 off)* | Up to 80% off package price (up to \$30)* |
| ENERGY STAR Certified LED Fixtures with Motion Sensors (+ solar option if available)                                                                                                                                         | Up to 70% off package price (up to \$25 off)* | Up to 80% off package price (up to \$30)* |
| Dimmer Switches or Wi-Fi Enabled Switches (single pack and multipack)                                                                                                                                                        | \$3/unit or up to 65% off package price       | \$3/unit or up to 65% off package price   |
| Indoor Motion Sensors                                                                                                                                                                                                        | \$5                                           | \$5                                       |
| Outdoor Motion Sensors                                                                                                                                                                                                       | \$8                                           | \$8                                       |
| Power Bars with Integrated Timers <sup>14</sup>                                                                                                                                                                              | \$5                                           | \$5                                       |
| Smart Power Strips (load sensing power strips only)                                                                                                                                                                          | \$10                                          | \$10                                      |
| Heavy-duty Outdoor Timers                                                                                                                                                                                                    | \$10/unit or up to 65% off package price      | \$10/unit or up to 65% off package price  |
| Programmable or Wi-Fi Enabled Thermostats for Electric Baseboard Heaters (single & multipacks)                                                                                                                               | \$25/unit or up to 65% off package price      | \$25/unit or up to 65% off package price  |
| Products Offered Year-Round                                                                                                                                                                                                  |                                               |                                           |

| *Represents changed incentives that were introduced during the 2024 spring and fall campaigns.                                                                                                                               |                                               |                                           |

<sup>14</sup> No power bars with integrated timers were rebated in 2024.

Instant Savings is typically advertised through point-of-purchase materials and signage, the Efficiency Nova Scotia (ENS) website, and other media including television commercials, social media, as well as print, online, and outdoor advertising. Consumer engagement events were held in participating retail stores during both campaign periods to provide information about Instant Savings and cross-promote other E1 programs, components, and services. In 2024, E1 ran a “Lights Out” campaign to make customers (and retailers) aware that 2024 would be the final year to take advantage of rebates on LED lamps and fixtures.

Instant Savings was aimed at achieving 12.544 GWh in net electrical energy savings and 1.680 MW in net peak demand savings at the generator in 2024.

## 5.2 Follow-up on Past Evaluation Report Recommendations

The Evaluator evaluated Instant Savings in previous years and issued improvement recommendations. Table 16 provides a summary on the implementation status of a past recommendation that has been carried forward.

**Table 16: Implementation Status of Past Recommendations for Instant Savings**

| #          | Past Recommendations                                                                                                                                                                                                                              | Status   | Comments                                                                                                                                                                                                                                                                                       |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2023-IS-R1 | Review the incented models in the LED non-A-type lamp category (R, BR, Decorative) and phase out in 2024 any models that are no longer pertinent for the program component given regulations and the market availability of non-LED replacements. | Complete | E1 agrees with this recommendation and has reviewed LED measures and phased out LED Non-A-Type bulbs, LED Fixtures, and LED Recessed Downlights measures starting in January 2025. Retailers have been sufficiently informed that 2024 was the final year for LED measures in Instant Savings. |

## 5.3 Participation History

In 2024, a total of 395,472 eligible products were sold in participating stores across Nova Scotia, which represents an increase of 82% compared to 2023.

As presented in Table 17 below, sales of ENERGY STAR certified non-A-type LED lamps remained stable with an increase of 0.1% compared to 2023, maintaining the levels after a decrease observed in 2022. LED fixture sales increased the most with a 204% difference compared to 2023. All products in this category increased significantly, especially solar fixtures with a 3,988% increase and LED recessed downlight fixtures with a 305% increase. Overall sales of control products in 2024 remained stable, smart thermostat sales increased by 191%, while sales for dimmer switches, indoor and outdoor motion sensors, heavy duty outdoor timers, and programmable thermostats decreased.

Sales in the appliance product category decreased by 11% driven by a decrease in units sold for room air purifiers (-34%), ENERGY STAR dehumidifiers (-23%), as well as ENERGY STAR certified clothes washers (-12%) and dryers (-4%).

| <b>Total</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <b>217,125</b> | <b>395,472</b> | <b>↑</b>  | <b>82%</b> |
| <sup>a</sup> Including ENERGY STAR certified LED fixtures with and without motion sensors, ENERGY STAR certified LED recessed downlight fixtures, and solar fixtures.<br><sup>b</sup> Including dimmer switches, indoor and outdoor motion sensors, heavy-duty outdoor timers, programmable thermostats, smart thermostats for electrical heat and in-floor heating, and smart power bars.<br><sup>c</sup> ENERGY STAR certified clothes washers and dryers, ENERGY STAR certified combination washer and dryer units, ENERGY STAR certified dishwashers, ENERGY STAR certified dehumidifiers, ENERGY STAR certified room air purifiers and ENERGY STAR certified bathroom & utility fans. |                |                |           |            |

As illustrated in Figure 7 below, LED fixtures surpassed lamps in the number of products sold with 68% of sales, while LED recessed downlight fixtures represented 68% and LED fixtures without motion sensors represented 28% of total LED fixtures sales. LED lamps followed fixtures with 20% of total sales.

Instant Savings gross energy savings significantly increased by 73% compared to 2023 levels. Gross savings from lighting products increased by 121% driven in large part by increased sales in LED fixtures. LED lamps and fixtures comprised 69% of gross savings. Savings from non-lighting products increased by 17% compared to 2023. Products other than LED lamps and fixtures constituted 31% of gross energy savings, with ENERGY STAR certified room air purifiers (11%) and smart thermostats for electrical baseboards (10%) being top drivers of gross energy savings.

Figure 7: Overview of Participation in Instant Savings, 2016-2024

## 6 Instant Savings Evaluation Approach

The 2024 Instant Savings evaluation included a comprehensive impact evaluation whereby NTGRs, namely free-ridership, as well as unitary savings were reviewed and updated. The main objectives of the 2024 Instant Savings evaluation were as follows:

- › Calculate gross and net Instant Savings results, namely electrical first-year and lifetime energy savings, peak demand savings, as well as avoided GHG emissions.

The Evaluator identified key research questions aimed at achieving these objectives. Table 18 outlines the evaluation objectives and maps them to the Evaluator's research questions, methods, and sample sizes (n). Each method is described further below.

**Table 18: 2024 Instant Savings Evaluation Approach**

| Evaluation Objective    | Research Question                                                                                                                                                                                                                                                                                    | Methodology                                                                                                                                                                                                                   |

### Participant Online Survey

Narrative Research staff conducted an online participant survey with 41 consumers who purchased qualifying non-A-type LED lamps, 98 who purchased recessed downlight fixtures, and 61 who purchased other LED fixtures during the fall campaign, for a total of 200 survey participants.

The online survey was conducted throughout the 2024 fall campaign via the use of cards with a survey link distributed to consumers at participating retail locations. Completed surveys were collected through samples from Costco, Kent, and Home Depot store locations.

The average length of the survey was 10 minutes. The questionnaire used is presented in Appendix III, and complete participant survey results are outlined in Appendix IV. The online survey sample of 200 participants yields a maximum margin of error of  $\pm 5.7\%$  at a 90% confidence level.

### Tracking Sheet Audit

The Evaluator performed an audit of the final 2024 tracking sheet to ensure it was complete and the entered data were consistent. The results obtained are presented in Appendix V.

## Unitary Savings Review

A unitary savings review was conducted for all measures as part of a major update to the 2024-2025 DSM Measure Assessment (DSM MA).<sup>15</sup> The unitary savings review consisted of a literature review of technical reference manuals, metering studies, and program evaluation documents to determine if there were more appropriate<sup>16</sup> methodologies or parameters to be applied to calculate energy and peak demand unitary savings, including elements such as baseline assumptions, operation hours, efficiency levels, peak demand-to-energy ratios, and interactive effects factors.

## EUL Update

For 2024, the Evaluator conducted a review of all EUL values as part of the 2024-2025 DSM MA update to determine if there were more appropriate EUL estimates.

## Calculations Using Evaluation Results

Building on all the above methods and collected data, the Evaluator calculated first-year and lifetime energy and peak demand savings as per the calculation methodology presented in Section 7 below.

## GHG Emission Reduction Calculations

To obtain net avoided GHG emissions in CO<sub>2</sub> eq for Instant Savings, the Evaluator multiplied the net energy savings by the latest Nova Scotia-specific factor for GHG emissions generated by electricity production. This factor was provided by NS Power data.

## Note on Margin of Error

For evaluation activities that yield quantitative results based on a sample, the Evaluator aimed to achieve a maximum margin of error of 10% at a confidence level of 90%. This means that, if measurements were conducted many times with different samples, the data would be within ten percentage points above or below the percentage reported 90% of the time. Thus, the margin of error indicates the relative level of precision<sup>17</sup> of a measurement, while its associated confidence level indicates the probability of a measurement falling within the margin of error.<sup>18</sup>

As part of the Instant Savings evaluation, the Evaluator calculated the margins of error for free-ridership levels. The margins of error are listed alongside results in the applicable sections below. Examples of calculations used to establish margins of error are provided in Appendix II of the 2024 DSM Programs Evaluation Executive Summary.

---

<sup>15</sup> The 2024-2025 DSM MA is a reference document that provides an in-depth review of all parameters necessary to calculate the annual and lifetime gross energy and peak demand savings of most prescriptive measures and some semi-prescriptive measures offered through E1's DSM program portfolio. In addition, the Measure Assessment includes effective useful life values for all measures offered in E1's program portfolio. For the remainder of the evaluations to be conducted during the 2023-2025 DSM cycle, the Evaluator will refer to the values presented in the 2024-2025 DSM MA.

<sup>16</sup> The Evaluator will judge whether new studies are more appropriate based on various factors, including but not limited by the following: The similarities between the measures implemented in the given study and E1's measures, the similarities in terms of climate or market conditions, the size of the sample studied, whether a study is recent, the quality of the study methodology, etc.

<sup>17</sup> Precision refers to how reproducible a set of measurements is. It does not consider how close the measured values are to the true values since this would refer to accuracy.

<sup>18</sup> As part of this evaluation, the confidence levels and margins of error only take random sampling errors into account; they do not reflect non-sampling errors or biases such as data entry errors, inaccurate responses from respondents, or the inability to contact certain people.

## 7 Instant Savings Impact Evaluation

The objectives of the 2024 Instant Savings impact evaluation were to determine gross and net electrical energy and peak demand savings, annually avoided GHG emissions, as well as effective useful life (EUL) values and associated lifetime energy savings.

### 7.1 Tracking Sheet Audit

To ensure program component results were reliably compiled, the Evaluator first performed a tracking sheet audit aimed at verifying the completeness and consistency of the data submitted by E1. The verification and corrective actions taken by the Evaluator, where applicable, are described in Appendix V. The tracked savings results presented in this report therefore refer to the corrected tracked savings obtained by the Evaluator.

### 7.2 Gross Savings

For Instant Savings, gross savings correspond to the change in energy consumption resulting from eligible energy efficient products being purchased by participants regardless of why they participated.<sup>19</sup>

#### 7.2.1 Installation Rates

The installation rates of products sold under Instant Savings are assumed to be 100% except for smart power controllers for audiovisual equipment (smart power strips) for which the installation rate was updated to 86% as part of the 2024-2025 DSM MA Update. Please refer to the 2024-2025 DSM MA for more details.

#### 7.2.2 Unitary Energy Savings

Table 19 below summarizes the tracked and evaluated energy savings values for the product categories rebated through Instant Savings, which were revised as part of the 2024-2025 DSM MA update. Detailed descriptions of inputs, references, and unitary savings for all products are provided in the 2024-2025 DSM MA. The unitary savings for all other measures remain unchanged.

---

<sup>19</sup> Definition adapted from: National Renewable Energy Laboratory, The Uniform Methods Project Chapter 23: Estimating Net Savings: Common Practices, September 2014, p. 3.

**Table 19: 2024 Instant Savings Tracked and Evaluated Unitary Energy Savings**

| Product                                                                        | Tracked Savings [kWh/year] | Evaluated Savings [kWh/year] |
|--------------------------------------------------------------------------------|----------------------------|------------------------------|
| ENERGY STAR Certified LED Non-A-type Lamps (R, BR, and Decorative)             | 49.2                       | 43.2                         |

## 7.2.3 Unitary Peak Demand Savings

Peak demand savings correspond to the demand savings that coincide in time with the peak demand period of the electricity system. The projected electricity peak demand period in Nova Scotia is defined as the coldest days (with an on-peak temperature estimated at -15 °C) between 5 p.m. and 7 p.m. in the months of December to February on non-holiday weekdays. The Evaluator developed unitary peak demand savings for each measure for all products, and the differences between tracked and evaluated peak demand savings reflect updates made to the unitary energy savings of those products. The peak demand-to-energy ratios used are presented in the 2024-2025 DSM MA.

Table 20 below summarizes the tracked and evaluated unitary peak demand savings for the product categories rebated through Instant Savings, which were revised as part of the 2024-2025 DSM MA update. The unitary peak demand savings for all other measures remain unchanged.

**Table 20: 2024 Instant Savings Tracked and Evaluated Unitary Peak Demand Savings**

| Product                                                                      | Tracked Savings [W/year] | Evaluated Savings [W/year] |
|------------------------------------------------------------------------------|--------------------------|----------------------------|
| ENERGY STAR Certified LED Non-A-type Lamps (R, BR, and Decorative)           | 7.97                     | 7.00                       |
| ENERGY STAR Certified LED Non-A-type Lamps (excluding R, BR, and Decorative) | 6.84                     | 6.69                       |

| ENERGY STAR Certified Bathroom and Utility Fans                              | 0.70                     | 14.3                       |

#### 7.2.4 Interactive Effects

In a home, interactive effects occur when implementing energy efficiency measures has an impact on the energy consumption of other elements such as heating and cooling. Interactive effects occur only when products are installed inside homes. In the case of Instant Savings, replacing incandescent lighting products with LED lamps results in an increase in the heating load during winter and a decrease in the cooling load during summer.

#### Lighting Products and Controls

The weighted interactive effects factors for lighting products were established as part of the 2024-2025 DSM MA update and included the various types of space heating and cooling found in Nova Scotia homes. Table 21 presents the interactive effects factors for LED products.

**Table 21: 2024 Instant Savings Interactive Effects Factors for Lighting Products**

| Product Category - LED Lamps, Fixtures, and Other Indoor Devices             | Weighted Energy Interactive Effects Factor | Weighted Peak Demand Interactive Effects Factor | Indoor % | Outdoor % | Energy Interactive Effects Factor | Peak Demand Interactive Effects Factor |
|------------------------------------------------------------------------------|--------------------------------------------|-------------------------------------------------|----------|-----------|-----------------------------------|----------------------------------------|
| ENERGY STAR Certified LED Non-A-type Lamps (R, BR, and Decorative)           | -17.7%                                     | -46.8%                                          | 92%      | 8%        | -16.3%                            | -43.1%                                 |
| ENERGY STAR Certified LED Non-A-type Lamps (excluding R, BR, and Decorative) | -17.7%                                     | -46.8%                                          | 92%      | 8%        | -16.3%                            | -43.1%                                 |
| ENERGY STAR Certified LED Recessed Downlight Fixtures                        | -17.7%                                     | -46.8%                                          | 100%     | 0%        | -17.7%                            | -46.8%                                 |
| ENERGY STAR Certified LED Fixtures                                           | -17.7%                                     | -46.8%                                          | 100%     | 0%        | -17.7%                            | -46.8%                                 |
| ENERGY STAR Certified LED Fixtures with Motion Sensors                       | -17.7%                                     | -46.8%                                          | 3%       | 97%       | -0.5%                             | -1.4%                                  |
| Indoor Motion Sensors                                                        | -17.7%                                     | -46.8%                                          | 100%     | 0%        | -17.7%                            | -46.8%                                 |
| Dimmer Switches                                                              | -17.7%                                     | -46.8%                                          | 100%     | 0%        | -17.7%                            | -46.8%                                 |
| Solar Fixtures                                                               | 0%                                         | 0%                                              | 0%       | 100%      | 0%                                | 0%                                     |

## Other Products

No interactive effects factors were calculated for power bars, outdoor devices, and thermostats sold through Instant Savings. For clotheslines and outdoor drying racks as well as large appliances, interactive effects were considered negligible.

### 7.2.5 Effective Useful Life

The Evaluator validated the EUL values based on the 2024-2025 DSM MA. The EUL values are used in the calculation of electrical energy savings that are expected to persist over time. The baseline for LED lamps reflects the changes made as part of the 2022 evaluation that included the assumption that LED lamps will become the baseline starting in 2025 given indications that the market is rapidly moving away from compact fluorescent lamps. This is discussed in further detail in Appendix II of the 2024-2025 DSM MA.

Table 22 below summarizes the tracked and evaluated equivalent EUL values for product categories rebated through Instant Savings, which were revised as part of the 2024-2025 DSM MA update. The EUL values for all other measures remain unchanged.

The evaluated equivalent EUL values were applied to the gross and net first-year electrical energy savings of each product to obtain gross and net lifetime energy savings (see Subsections 7.2.6 and 7.3.4 below). The weighted average gross EUL value is 3.8 years, and the weighted average net EUL value is 4.4 years.

**Table 22: 2024 Instant Savings Equivalent EUL and Gross Lifetime Unitary Savings Values**

| Product                                                                      | Tracked Equivalent EUL [years] | Evaluated Equivalent EUL [years] | Evaluated Gross Lifetime Unitary Savings [kWh] |
|------------------------------------------------------------------------------|--------------------------------|----------------------------------|------------------------------------------------|
| ENERGY STAR Certified LED Non-A-type Lamps (R, BR, and Decorative)           | 2.0                            | 1.0                              | 43.2                                           |
| ENERGY STAR Certified LED Non-A-type Lamps (Excluding R, BR, and Decorative) | 2.0                            | 1.0                              | 41.3                                           |
| ENERGY STAR Certified LED Recessed Downlight Fixtures                        | 2.0                            | 1.0                              | 52.8                                           |
| ENERGY STAR Certified LED Fixtures Without Motion Sensors                    | 2.0                            | 1.0                              | 83.8                                           |
| ENERGY STAR Certified LED Fixtures with Motion Sensors                       | 2.9                            | 1.6                              | 322                                            |
| Solar Fixtures                                                               | 3.2                            | 1.9                              | 154                                            |
| ENERGY STAR Certified Heat Pump Water Heaters                                | 10.0                           | 15.0                             | 15,105                                         |

## 7.2.6 Evaluated Gross Savings

Annual gross savings are based on the evaluated unitary savings values established for each product sold in 2024. The results are presented in Table 23 below.

The gross savings at the generator were estimated by using a line loss factor of 1.0947 and 1.1466 for energy and peak demand savings respectively.<sup>20</sup> The line loss factors were updated in 2019 and correspond to the values submitted to the Nova Scotia Utility and Review Board as part of the 2014 Cost of Service Study Progress Update.<sup>21</sup>

<sup>20</sup> For municipal utility participants, the line loss factor for the most similar NS Power rate code was assumed. If a municipal utility participant did not have a specific rate code, the average of participants for which the line loss was known was used.

<sup>21</sup> Nova Scotia Utility and Review Board, Matter M06555, 2014 Cost of Service Study Progress Update, Exhibit N-2.09, Appendix I1.

**Table 23: Evaluated 2024 Instant Savings Gross Electrical Energy and Peak Demand Savings**

| Product Category                                       | LED Non-A-type Lamps  |        | LED Recessed Downlight Fixtures | ENERGY STAR LED Fixtures |                     |                | Dimmer Switches | Indoor Motion Sensors | Outdoor Motion Sensors |

Figure 8 and Figure 9 below compare tracked unitary electrical energy and peak demand savings to evaluated gross savings. Both sets of savings values include adjustments to account for interactive effects. As outlined in the figures, the most significant difference in gross energy and peak demand savings came from the revision of the unitary energy savings and unitary peak demand savings value for LED fixtures, notably solar fixtures, and room air purifiers.

**Figure 8: 2024 Instant Savings Tracked and Evaluated Gross Energy Savings**

Figure 9: 2024 Instant Savings Tracked and Evaluated Gross Peak Demand Savings

As presented in Table 24, GHG emission reductions were calculated by applying the Nova Scotia-specific factor<sup>22</sup> for GHG emissions generated by electricity production to Instant Savings gross savings.

**Table 24: Evaluated 2024 Instant Savings Gross GHG Emission Reductions**

|                                                                                             | Total         |

| Nova Scotia-specific GHG Emissions Factor for Electricity Production (tonnes of CO2 eq/GWh) | 472.2         |
| <b>Gross Annual GHG Emission Reductions (tonnes of CO2 eq)</b>                              | <b>12,695</b> |

## 7.3 Net Savings

The Evaluator determined the net energy and peak demand savings, that is the electrical energy and peak demand savings that can be reliably attributed to a program component, by estimating the NTGR. In the case of Instant Savings, free-ridership and spillover are considered for three specific products, namely LED lamps, LED recessed downlight fixtures (simplified as recessed fixtures), and other LED fixtures. Those products were selected since they remain the best-selling product categories of the program component, accounting for 69% of total gross savings.

### 7.3.1 Free-ridership

Free-ridership levels are calculated using algorithms that assess the likelihood of participants purchasing LED lamps or fixtures without the discount offered through Instant Savings. The algorithms consider all applicable variables in the decision-making process, including awareness about the given discount, cost, timing, and quantity. The algorithms underlying the free-ridership calculations are presented in Appendix VI.

The free-ridership levels were assessed using a self-reporting approach that involved asking a series of questions through an online intercept survey to participants who had purchased LED lamps, recessed fixtures, or other LED fixtures.

Program sales are split between Costco and non-Costco stores. For Instant Savings, Costco accounts for 63% of lighting product sales and non-Costco stores account for the remaining 37%. Given the relatively large portion of lighting sales from Costco stores and indications based on 2019 data that Costco consumers may have different behaviours than consumers at other retailers, the Evaluator established free-ridership levels associated with Costco and non-Costco consumers of LED lamps and LED fixtures.

The Evaluator calculated a free-ridership level associated with Costco participants as well as non-Costco participants who purchased LED lamps. However, the 2024 online survey did not serve to collect sufficient responses from participants that purchased LED fixtures at non-Costco stores. Therefore, the Evaluator used 2023 results to establish a free-ridership level associated with non-Costco purchasers of LED fixtures. Similar methodologies were used in the 2022 evaluation. The following subsections present the results.

<sup>22</sup> At the time of writing, 2024 data were not yet available. The Nova Scotia-specific factor was obtained from Nova Scotia Power's 2023 total system emissions data (4,931,152 CO2 eq tonnes), and total electricity generation (10,442 GWh) was drawn from the following two sources: Nova Scotia Power, Total System Emissions, <https://www.nspower.ca/clean-energy/air-emissions-reporting> (last accessed September 27, 2024), and Emera Inc., Emera Inc. 2023 Annual Report, p. 31, available at [https://s25.q4cdn.com/978989322/files/doc\\_financials/2023/ar/Emera\\_2023\\_AR\\_FINAL.pdf](https://s25.q4cdn.com/978989322/files/doc_financials/2023/ar/Emera_2023_AR_FINAL.pdf) (last accessed September 27, 2024).

## Measurement of Free-ridership for Costco Participants

The free-ridership results for Costco participants are presented in Table 25 below.

**Table 25: 2024 Instant Savings Free-ridership for Costco Participants**

| Product Category  | Free-ridership |                 |
|-------------------|----------------|-----------------|
|                   | Level          | Margin of Error |
| LED Lamps         | 16%            | 7.1%            |
| LED Fixtures      | 19%            | 9.1%            |
| Recessed Fixtures | 18%            | 4.7%            |

For Costco participants, the intercept survey revealed a free-ridership level of 16% for LED lamps sold through Instant Savings in 2024. This level is lower than the 36% obtained for Costco participants during the 2022 evaluation, which was the last time data were collected for Costco participants. This decrease is mostly due to the lower proportion of Costco participants who were unaware of the discount before paying in 2024 (0% for LED lamps and 16% for fixtures) compared to 2022 (33% for lamps and 57% for fixtures). In addition, both the proportion of people that would have bought products at full price or the same number of products without the discount decreased compared to 2022.

Free-ridership for recessed fixtures could not be established for 2024. Combined, the free-ridership established for all LED fixtures is 18%, lower than the 50% obtained in 2022. Reasons for this free-ridership decrease for LED fixtures is similar to that for LED lamps.

As for all other types of products rebated through Instant Savings, the Evaluator considered the free-ridership values to be nil.

## Measurement of Free-ridership for Non-Costco Participants – LED Lamps

The free-ridership results for LED lamps for non-Costco participants are presented in Table 26 below.

**Table 26: 2024 Instant Savings Free-ridership for Non-Costco Participants**

| Product Category | Free-ridership |                 |
|------------------|----------------|-----------------|
|                  | Level          | Margin of Error |
| LED Lamps        | 51%            | 14.7%           |

For non-Costco participants, the intercept survey revealed a free-ridership level of 51% for LED lamps, which is lower than the 70% established in 2023. While the margin of error is higher than 10%, the Evaluator elected to use this result as Costco results also indicated a similar reduction in free-ridership between 2023 and 2024.

## Treatment of Free-ridership for Non-Costco Participants – LED Fixtures

The 2023 results for non-Costco participants that purchased LED fixtures were based on an online survey that generally used the same questions and algorithms for LED lamps and fixtures as in 2024. The results are presented in Table 27.

**Table 27: 2024 Instant Savings Free-ridership Levels for Non-Costco Participants**

| Product Category | Free-Ridership |                 |
|------------------|----------------|-----------------|
|                  | Level          | Margin of Error |
| All LED Fixtures | 48%            | 10.3%           |

## 2024 Overall Free-ridership Levels

The overall free-ridership levels for LED lamps and fixtures correspond to the average of the 2024 Costco free-ridership levels, the 2024 non-Costco free-ridership levels for LED lamps, and the free-ridership of non-Costco consumers for LED fixtures obtained in 2023 weighted by the number of units sold in 2024 for each product category.

Table 28 outlines the free-ridership levels for LED lamps and LED fixtures.

**Table 28: 2024 Instant Savings Free-Ridership for LED Lamps and Fixtures**

| Product Category | Retailer   | Evaluation Period | Free-ridership |                 | Number of Units Sold in 2024 | Weighted Average Free-ridership |                 |
|------------------|------------|-------------------|----------------|-----------------|------------------------------|---------------------------------|-----------------|
|                  |            |                   | Level          | Margin of Error |                              | Level                           | Margin of Error |
| LED Lamps        | Costco     | 2024              | 16%            | 7.1%            | 26,620                       | 39%                             | 6.8%            |
|                  | Non-Costco | 2024              | 51%            | 14.7%           | 51,919                       |                                 |                 |
| LED Fixtures     | Costco     | 2024              | 18%            | 6.6%            | 193,579                      | 26%                             | 7.6%            |
|                  | Non-Costco | 2023              | 48%            | 10.3%           | 75,161                       |                                 |                 |

As for all other types of products rebated through Instant Savings, the Evaluator considered the free-ridership values to be nil. Table 29 outlines the free-ridership levels for products sold through Instant Savings in 2024.

**Table 29: 2024 Instant Savings Free-ridership**

| Product Category   | Free-ridership |                 |
|--------------------|----------------|-----------------|
|                    | Level          | Margin of Error |
| LED Lamps          | 39%            | 6.8%            |
| LED Fixtures       | 26%            | 7.6%            |
| All Other Products | 0              | 0               |

## 7.3.2 Spillover

Throughout the year, sales of eligible products may have occurred due to the influence of Instant Savings even if no discount was offered. This influence is due to better knowledge and awareness about energy efficient products and changes in retailer offerings. These sales should be attributable to the program component as a form of market effects.

For the 2024 evaluation, the Evaluator used the spillover levels from the 2023 evaluation. Table 30 below outlines the spillover level by product category. The Evaluator considered the spillover values for all other products rebated through Instant Savings to be nil.

**Table 30: 2024 Instant Savings Spillover Levels**

| Product Category   | Spillover Level |
|--------------------|-----------------|
| LED Lamps          | 9%              |
| LED Fixtures       | 2%              |
| All Other Products | -               |

### 7.3.3 Net-to-gross Ratio Calculations

The NTGR is calculated using the following equation.

$$NTGR = (1 - \% \text{ Free-ridership} + \% \text{ Spillover})$$

Using this equation, the NTGRs for LED lamps and LED fixtures were estimated at 0.70 and 0.76 respectively, as presented in Table 31 below. For all other products, a NTGR of 1.00 was used.

The free-ridership and spillover levels for non-LED products were not assessed through this evaluation. Units such as dimmer switches, occupancy sensors, and power bars are specialized products grouped into broader retail categories, which makes it difficult for retailers to estimate program component influence on product sales. Moreover, the population segments for these products are smaller, which make it more difficult to reach those consumers through an online survey or general population survey. A margin of error is not presented for spillover since it was established by census. Table 31 summarizes the NTGR of each product category based on the respective free-ridership and spillover levels.

**Table 31: 2024 Instant Savings Net-to-gross Ratios**

| Product Category   | Weighted Average Free-ridership |                 | Spillover | Net-to-gross Ratio |
|--------------------|---------------------------------|-----------------|-----------|--------------------|
|                    | Level                           | Margin of Error |           |                    |
| LED Lamps          | 39%                             | 6.8%            | 9%        | 0.70               |
| All LED Fixtures   | 26%                             | 7.6%            | 2%        | 0.76               |
| All Other Products | 0                               | 0               | 0         | 1.00               |

### 7.3.4 Evaluated Net Savings

Net savings are defined as the changes in energy use that are attributable specifically to Instant Savings. Net program component impacts were estimated by applying the overall NTGR to gross savings, as exemplified in the following equation.

$$\text{Net Savings} = \text{Gross Savings} \times \text{NTGR}$$

This equation was used to calculate both net electrical energy savings and net peak demand savings.

The detailed results are presented in Table 32 below. The net energy savings resulted in 10,508 tonnes of CO<sub>2</sub> eq in net annual GHG emission reductions.

**Table 32: Evaluated 2024 Instant Savings Net Energy and Peak Demand Savings**

| Product Category                                     | LED Non-A-type Lamps  |        | LED Recessed Downlight Fixtures | LED ENERGY STAR Fixtures |                     |                | Dimmer Switches | Indoor Motion Sensors | Outdoor Motion Sensors |
|------------------------------------------------------|-----------------------|--------|---------------------------------|--------------------------|---------------------|----------------|-----------------|-----------------------|------------------------|

As outlined in Figure 10 below, Instant Savings exceeded both its electrical energy and peak demand savings targets by 77% and 45% respectively.

**Figure 10: 2024 Instant Savings Targets and Evaluated Results**

## 7.4 Realization Rate

Table 33 below compares the energy and peak demand savings established through this evaluation to those tracked by E1. It also includes the realization rate, representing the ratio of evaluated net savings to tracked net savings, for both energy savings and peak demand savings.

**Table 33: Comparison of 2024 Instant Savings Tracked and Evaluated Savings at the Generator**

|                                                                                                                                                                  | Gross Savings |      | NTGR* | Net Savings |      | Realization Rate |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|------|-------|-------------|------|------------------|
|                                                                                                                                                                  | Value         | Unit | Value | Value       | Unit | Value            |
| Energy Savings                                                                                                                                                   |               |      |       |             |      |                  |
| Tracked Savings by E1                                                                                                                                            | 29.151        | GWh  | 0.66  | 19.129      | GWh  | 116%             |

| *NTGRs varied for each product category. The NTGRs presented in this table correspond to the rounded averages obtained by dividing net savings by gross savings. |               |      |       |             |      |                  |

The evaluated net energy savings were higher than the value tracked by E1 (16%). The evaluated gross savings were lower than those tracked by E1 (-8%) mainly due to updates in the unitary savings values for several products, notably LED fixtures. This was counterbalanced by an increase in the NTGR due to a decrease in free-ridership for LED lamps and fixtures.

The evaluated net peak demand savings were also 10% higher than those tracked by E1 for the same reasons.

## 8 Instant Savings Key Findings and Recommendations

The 2024 Instant Savings evaluation included a comprehensive impact evaluation whereby NTGRs, notably for free-ridership, as well as unitary savings were reviewed and updated. The main objectives of the 2024 Instant Savings evaluation were as follows:

- › Calculate gross and net results, namely electrical first-year and lifetime energy savings, peak demand savings, as well as avoided GHG emissions.

This section provides the Evaluator's key findings in relation to the above objectives. The Evaluator has no specific recommendation for Instant Savings.

**2024 Instant Savings-Finding: Instant Savings surpassed both its net electrical energy savings and peak demand savings targets by 77% and 45% respectively.**

Instant Savings achieved 22.252 GWh in net electrical energy savings and 2.428 MW in net peak demand savings at the generator in 2024, thus surpassing the planned net electrical energy savings and net peak demand savings of 12.544 GWh and 1.680 MW respectively.

**2024 Instant Savings-Finding: Program participation levels in 2024 increased by 82% compared to 2023 levels, likely driven by E1's Lights Out campaign, with ENERGY STAR certified LED fixtures and ENERGY STAR certified non-A-type LED lamps being the largest drivers of participation.**

E1 ran a campaign in 2024 to make customers and retailers aware that 2024 would be the final year to take advantage of rebates on LED lamps and fixtures. In 2025, the new baseline for certain residential lighting measures will be LED, making 2024 the last year of savings for these products in Instant Savings. The ENERGY STAR certified LED fixture products saw an increase of 204%, representing 68% of total units sold.

**2024 Instant Savings-Finding: Savings from products other than lighting increased in 2024, while most savings continued to come from LED lighting products.**

ENERGY STAR certified LED fixture products and ENERGY STAR certified non-A-type LED lamps continued to be the largest contributors to participation and savings for the program component, generating 69% of 2024 savings. E1 will stop rebating LED lamps and fixtures in 2025. Non-lighting products saw a 17% increase in savings in 2024 compared to 2023 levels.

**2024 Instant Savings-Finding: The free-ridership level for both LED lamps and LED fixtures decreased in 2024.**

In 2024, the free-ridership level for LED lamps was established at 39% compared to 59% in the 2023 evaluation. The free-ridership level for LED fixtures for Costco participants was 18% compared to 50% established in 2022. Combining these results with 2023 results for non-Costco participants resulted in an overall free-ridership of 26% for LED fixtures.

**2024 Instant Savings-Finding: The evaluated net electrical energy savings and net peak demand savings determined by the Evaluator were higher than the net savings tracked by E1.**

The evaluated net energy and peak demand savings were 16% and 10% higher than the values tracked by E1, respectively. This was due to the higher NTGR established for LED lamps and LED fixtures in 2024.

## CONCLUSION

Table 34 presents the participation levels, NTGRs, evaluated gross and net savings at the generator, annual GHG emission reductions, as well as EUL values for each Residential Efficient Product Rebates program component and for the program as a whole.

**Table 34: Overall 2024 Residential Efficient Product Rebates Participation and Evaluated Savings**

|                                | Participation Level |               | Gross Savings |                  | NTGR  | Net Savings |                  |

| Annual GHG Emission Reductions |                     |               | 14,676        | Tonnes of CO2 eq | 0.79  | 11,625      | Tonnes of CO2 eq |
| EUL                            |                     |               | 3.8           | GWh              |       | 4.4         | Years            |

Figure 11 and Figure 12 below illustrate the net electrical energy and peak demand savings targets respectively for each program component and for Residential Efficient Product Rebates as a whole. Residential Efficiency Product Rebates achieved its targets in 2024. Residential Efficient Product Rebates was aimed at achieving 14.481 GWh in net electrical energy savings and 1.967 MW in net peak demand savings at the generator for 2024. The program exceeded the net electrical energy savings target by 70% and peak demand savings target by 41%, mostly driven by Instant Savings which remains the largest contributor to total program net electrical energy and peak demand savings.

**Figure 11: 2024 Residential Efficient Product Rebates Program Targeted and Evaluated Net Electrical Energy Savings**

## APPENDIX I

### ARet Tracking Sheet Audit

This appendix presents the main results of the tracking sheet audit performed by the Evaluator, which was aimed at:

- › Verifying that all data fields required for the evaluation were included and filled out in the tracking sheet submitted by EfficiencyOne (E1)
- › Ensuring that tracked results were accurate by:
  - › Verifying that parameters used to calculate program results (gross and net energy and peak demand savings at the generator) were consistent with previous evaluation results
  - › Validating that all calculation steps were performed consistently

Table 1 presents the corrected tracked savings resulting from all changes made by the Evaluator.

**Table 1: 2024 ARet Corrected Tracked Savings**

| Program Component Results                  | Value Tracked by E1 |      | Corrected Tracked Value |      | Relative Difference |
|--------------------------------------------|---------------------|------|-------------------------|------|---------------------|
|                                            | Value               | Unit | Value                   | Unit | Value               |
| <b>ARet</b>                                |                     |      |                         |      |                     |
| Gross Energy Savings at the Generator      | 4.211               | GWh  | 4.212                   | GWh  | 0.02%               |
| Gross Peak Demand Savings at the Generator | 0.602               | MW   | 0.602                   | MW   | -0.03%              |
| Net Energy Savings at the Generator        | 2.373               | GWh  | 2.374                   | GWh  | 0.02%               |
| Net Peak Demand Savings at the Generator   | 0.339               | MW   | 0.339                   | MW   | -0.03%              |

Overall, the difference between tracked and corrected values is minor. The difference in gross electrical energy and peak demand savings is mainly due to the different rounding method used by the Evaluator for peak demand-to-energy ratios and line loss factors. The impact is negligible.

## APPENDIX II

### ARet 2024 Recommendations

The Evaluator made no specific recommendation as part of the 2024 evaluation of ARet.

## APPENDIX III

### Instant Savings Participant Online Survey Questionnaire

## A. Identification and Screening of Respondent

Thank you for taking the time to answer the following short survey about energy efficiency. We are gathering information from customers who purchased certain energy-efficient LED bulbs or LED fixtures between September 23rd and November 17th. This survey should take about 5 minutes to complete.

A1. Where did you purchase your LED bulbs or LED fixtures?

1. Costco
2. The Home Depot
3. Kent

A2. Please enter the SKU number for the LED bulbs or LED fixtures you recently purchased.

- › If you purchased both LED fixtures as well as LED bulbs, please enter the SKU number for a fixture.

A3. If you purchased more than one package of LED bulbs, please enter the SKU number for a package of non-pear-shaped LED bulbs, such as those illustrated below.

- › If you purchased more than one LED fixture, please enter the SKU number for any one fixture.

: \_\_\_\_\_

| Pear-Shaped LED Bulbs                                                               |                                                                                     | Non-Pear-Shaped LED Bulbs                                                           |                                                                                      |                                                                                       |
|-------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------|
|  |  |  |  |  |

## LED BULB SURVEY [ASK IF SKU = NON-A-TYPE LED BULB]

### B. Purchase – LED Bulbs

- B1. How many non-pear-shaped LED bulbs did you purchase? Please enter the number of bulbs, not packages.
1. Enter number of LED bulbs bought: \_\_\_\_ **[NUMBER OF BULBS MUST BE ≥ 1].**
  98. Don't know **[ASK RESPONDENT TO PROVIDE ESTIMATE TO CONTINUE SURVEY. IF UNABLE, THANK AND TERMINATE]**
- B2. **[IN B1 IF NUMBER OF BULBS IS > 50 BULBS]** You just entered that you purchased **[ANSWER FROM B1]** LED bulbs. Is that quantity correct?
1. Yes
  2. No **[CORRECT THE NUMBER OF BULBS FROM B1 \_\_\_\_ CAN'T EXCEED 100 BULBS]**
  98. Don't know **[ASK RESPONDENT TO PROVIDE ESTIMATE TO CONTINUE SURVEY. IF UNABLE, THANK AND TERMINATE]**
- B3. Did you purchase these bulbs for your own use (for example, for your home or cottage) **[ALLOW ONE RESPONSE ONLY]**
1. I purchased them for my own use
  96. Other, please specify [\_\_\_\_\_]
- B4. Are there any non-pear-shaped LED bulbs currently installed in your home (other than those you just bought)? **[CODE ONE ONLY]**
1. Yes
  2. No
  98. Don't know
- B5. **[ASK IF B1 OR B2.2 = 1 BULB]** You bought one LED bulb. Do you plan on installing it... **[CODE ONLY ONE]**
1. To replace another LED bulb
  2. To replace a bulb that was not LED
  3. Into a new lamp or light fixture
  96. Other **[SPECIFY\_\_\_\_\_]**

B6. **[ASK IF B5=1]** Do you plan on installing this LED bulb... **[ALLOW ONLY ONE CODE]**

1. To replace an LED bulb once it burns out
2. To replace an LED bulb that is still working
96. Other [SPECIFY\_\_\_\_\_]

B7. **[ASK IF B5=2]** Do you plan on installing this LED bulb ... **[ALLOW ONLY ONE CODE ]**

1. To replace a bulb once it burns out
2. To replace a bulb that is still working
96. Other [SPECIFY\_\_\_\_\_]

B8. **[ASK IF B1 (IF CORRECT) OR B2.2 > 1 (MORE THAN 1 BULB)]** You bought **[INSERT NUMBER OF LEDS FROM B1 (IF CORRECT) OR B2.2]** LED bulbs. How many, if any, of these **[INSERT NUMBER OF LEDS FROM B1 (IF CORRECT) OR B2.2]** LED bulbs will be installed... **[TOTAL NUMBER OF BULBS RECORDED CAN'T BE HIGHER THAN COUNT IN B1 (IF CORRECT) OR B2.2] [ALL CATEGORIES (EXCEPT 'OTHER') NEED A NUMBER, ADD IN ZEROS FOR ANY THAT WERE NOT SELECTED ]**

1. To replace another LED bulb: \_\_\_\_\_
2. To replace a bulb that was not LED: \_\_\_\_\_
3. Into a new lamp or light fixture: \_\_\_\_\_
96. Other [SPECIFY\_\_\_\_\_]

B9. **[ASK IF B8.1 >0]** Concerning the LED bulbs that you will use to replace existing LED bulbs: do you plan on installing these bulbs mostly ... **[ALLOW ONLY ONE CODE ]**

1. To replace LED bulbs once they burn out
2. To replace LED bulbs that are still working
96. Other [SPECIFY\_\_\_\_\_]
98. Don't know

B10. **[ASK IF B8.2 >0]** Concerning the bulbs that you will use to replace existing non-LED bulbs: do you plan on installing these LED bulbs mostly ... **[ALLOW ONLY ONE CODE ]**

1. To replace bulbs once they burn out
2. To replace bulbs that are still working
96. Other [SPECIFY\_\_\_\_\_]
98. Don't know

B11. **[ASK IF B6=2 OR B9=2]** Why do you plan on replacing LED bulbs that are still working?

**ALLOW VERBATIM RESPONSE**\_\_\_\_\_

## C. Awareness of Program and Efficiency Nova Scotia – LED Bulbs

- C1. Have you ever heard of the Efficiency Nova Scotia program that offers instant savings at the cash register for the purchase of energy-efficient lighting, controls or appliances? **[ALLOW ONLY ONE CODE]**
1. Yes
  2. No
- C2. **[ASK IF C1=1]** How did you find out about this program? **[ALLOW MULTIPLE RESPONSES; MAKE DON'T KNOW EXCLUSIVE]**
1. TV ads
  2. Print ads
  3. Radio ads
  4. In-store promotions
  5. Store flyer
  6. Store personnel
  7. Efficiency Nova Scotia website
  8. Social Media (e.g., Facebook, Twitter/X, Instagram, Snapchat, TikTok, YouTube, etc.)
  9. Online advertisement on smart phone, computer or tablet
  10. YouTube video
  11. Word of mouth
  12. Through an Efficiency Nova Scotia representative during an in-store engagement event
  13. Through another Efficiency Nova Scotia program
  96. Other [SPECIFY \_\_\_\_\_]
  98. Don't know
- C3. The day you recently bought the LED bulb(s), did you see signs or posters in the light bulb section of the store promoting the discount offered on LED bulbs? **[ALLOW ONLY ONE CODE]**
1. Yes
  2. No
  98. Don't know

## D. Free-Ridership - LED Bulbs

- D1. Efficiency Nova Scotia offered a discount on non-pear-shaped LED bulbs. Before paying at the cash register, were you aware that a discount was offered on the purchase of LEDs? **[ALLOW ONLY ONE CODE]**
1. Yes **[GO TO D3]**
  2. No **[GO TO D2]**
  98. Don't know **[GO TO D2]**
- D2. **[ASK IF NOT AWARE OF THE DISCOUNT (D1=2, DK)]** To confirm, you did not know about the discount on specific LED bulbs before paying at the register? **[CODE ONE ONLY]**
1. Yes, I knew about the discount
  2. No, I did not know about the discount **[GO TO SECTION H]**
- [ASK THE FOLLOWING QUESTIONS IF AWARE OF THE DISCOUNT (D1=1) OR (D2=1), OTHERWISE SKIP TO SECTION H]**
- D3. Before the beginning of the rebate campaign on September 23rd, were you aware that discounts on LED bulbs would be offered this fall?
1. Yes
  2. No **[SKIP TO D6]**
- D4. Were you aware that this would be the last year to take advantage of Efficiency Nova Scotia discounts on LED bulbs?
1. Yes
  2. No
- D5. **[ASK IF YES IN D3]** Did you delay your purchase of LEDs to the beginning of the rebate campaign to take advantage of the discount?
1. Yes
  2. No
- D6. If the discount on LEDs had NOT been offered, what would you have bought? Would you have... **[ALLOW ONLY ONE CODE]**
1. Bought LEDs anyway
  2. Bought another type of bulb
  3. Not bought any bulbs

D7. **[ASK IF D6=2]** Which type(s) of bulb would you have purchased instead? **[ALLOW MULTIPLE RESPONSES]**

1. Incandescent
2. Halogen
3. CFLs
96. Other, SPECIFY: \_\_\_\_\_

D8. How likely would you have been to buy the LED bulbs that you purchased if you had to pay the full price? That is, how likely would have you have been to buy the LED bulbs that you purchased if you did not receive the [\$REBATE AMOUNT] discount? Please answer on a scale of 0 to 10, with a 0 indicating that you “Definitely Would Not Have Bought these LEDs” and a 10 indicating that you “Definitely Would Have Bought these LEDs.” **[DO NOT ACCEPT A RANGE]**

|                                             |   |   |   |   |   |   |   |   |   |                                         |
|---------------------------------------------|---|---|---|---|---|---|---|---|---|-----------------------------------------|
| Definitely Would Not Have Bought these LEDs | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | Definitely Would Have Bought these LEDs |
| 0                                           |   |   |   |   |   |   |   |   |   | 10                                      |

D9. If the discount had NOT been offered, when would you have purchased the LED bulbs that you did? **[ALLOW ONLY ONE CODE]**

1. **[INCLUDE IF D5=1]** Earlier
2. Definitely on the same day
3. Probably on the same day
4. Probably at a later date
5. Definitely at a later date
6. Would not have purchased them at all **[SKIP TO H SECTION]**

D10. **[ASK IF B1 (IF CORRECT) OR B2.2 >1 (MORE THAN 1 BULB)]** Without the **[\$REBATE AMOUNT]** discount, would you have definitely purchased the same number of LED bulbs, probably purchased the same number, probably purchased fewer or definitely purchased fewer? **[ALLOW ONLY ONE CODE]**

1. Definitely the same number
2. Probably the same number
3. Probably fewer
4. Definitely fewer

D11. **[ASK D4 = 1 (YES) AND IF D10 = 3 OR 4]** You bought **[INSERT NUMBER OF LEDS FROM B1 (IF CORRECT) OR B2.2]** LED bulbs, what proportion of these bulbs do you expect to install in the next 12 months? **[ALLOW ONLY ONE CODE]**

1. All or nearly all
2. About half
3. Less than half
4. None

**[NOTE TO PROGRAMMER: CONTINUE TO SECTION H]**

## **LED FIXTURE SURVEY [ASK IF SKU = LED FIXTURE]**

### **E. Purchase – LED Fixtures**

E1. How many LED fixtures did you purchase? Please enter the number of fixtures, not packages.

1. Enter number of LED fixtures bought: \_\_\_\_ **[NUMBER OF FIXTURES MUST BE ≥ 1].**
98. Don't know **[ASK RESPONDENT TO PROVIDE ESTIMATE TO CONTINUE SURVEY. IF UNABLE, THANK AND TERMINATE]**

E2. **[IN E1 IF NUMBER OF FIXTURES IS > 50 FIXTURES]** You entered that you purchased **[ANSWER FROM E1]** LED fixtures. Is that quantity correct?

1. Yes
2. No **[CORRECT THE NUMBER OF FIXTURES FROM E1 \_\_\_\_ CAN'T EXCEED 100 FIXTURES]**
98. Don't know **[ASK RESPONDENT TO PROVIDE ESTIMATE TO CONTINUE SURVEY. IF UNABLE, THANK AND TERMINATE]**

- E3. Did you purchase these fixtures for your own use (for example, for your home or cottage)? **[ALLOW ONE RESPONSE ONLY]**
1. I purchased them for my own use
  96. Other, please specify [\_\_\_\_\_]
- E4. Are there any LED fixtures currently installed in your home (other than those you just bought)? **[ALLOW ONLY ONE CODE]**
1. Yes
  2. No
  98. Don't know
- E5. Will the LED fixture(s) you bought be installed indoor or outdoor? **[ALLOW ONLY ONE CODE]**
1. Indoor
  2. Outdoor
  3. **[SHOW IF E1 (IF CORRECT) OR E2.2 > 1 FIXTURE]** Both
  96. Other [SPECIFY \_\_\_\_\_]
- E6. **[IF E1 (IF CORRECT) OR E2.2=1 FIXTURE]** For which of the following reasons did you buy this LED fixture? **[ALLOW ONLY ONE CODE]**
1. To replace a fixture that was still functional
  2. To replace a fixture that was broken/burnt out bulb
  3. To install in a place that did not have a fixture before
  96. Other [SPECIFY \_\_\_\_\_]
- E7. **[ASK IF E1 (IF CORRECT) OR E2.2 > 1 (MORE THAN 1 FIXTURE)]** You bought **[INSERT NUMBER FROM E1 (IF CORRECT) OR E2.2]** LED fixtures. How many, if any, of these **[INSERT NUMBER FROM E1 (IF CORRECT) OR E2.2]** LED fixtures will be installed... **[TOTAL NUMBER OF FIXTURES RECORDED CAN'T BE HIGHER THAN COUNT IN E1 (IF CORRECT) OR E2.2]**
- [NOTE TO PROGRAMMER: ALL CATEGORIES NEED A NUMBER (EXCEPT 'OTHER'), CODE AS ZEROS FOR ANY THAT WERE NOT SELECTED].**
1. To replace a fixture that was still functional
  2. To replace a fixture that was broken/burn out bulb
  3. To install in a place that did not have a fixture before
  96. Other [SPECIFY \_\_\_\_\_]

E8. **[DO NOT ASK IF E6=3 OR E7= EXCLUSIVELY 3]** What types of bulbs were installed in the fixtures that you plan on replacing? **[CODE AS MANY AS APPLY; SHOW BULB TYPES ON SCREEN; RANDOMIZED]**

1. LED bulbs
2. CFL bulbs
3. Halogen bulbs
4. Standard incandescent bulbs (those bulbs typically have wattages of 40 W, 60 W or 100 W).
5. Efficient incandescent bulbs (those bulbs look the same as incandescent bulbs but typically have wattages of 29 W, 43 W or 72 W)
96. Other [SPECIFY \_\_\_\_\_]

## **F. Awareness of Program and Efficiency Nova Scotia – LED Fixtures**

F1. Have you ever heard of the Efficiency Nova Scotia program that offers instant savings at the cash register for the purchase of energy-efficient lighting, controls or appliances? **[ALLOW ONLY ONE CODE]**

1. Yes
2. No

F2. **[ASK IF F1=1]** How did you find out about this program? **[ALLOW MULTIPLE RESPONSES; MAKE DON'T KNOW EXCLUSIVE]**

1. TV ads
2. Print ads
3. Radio ads
4. In-store promotions
5. Store flyer
6. Store personnel
7. Efficiency Nova Scotia website
8. Social Media (e.g., Facebook, Twitter/X, Instagram, Snapchat, TikTok, YouTube, etc.)
9. Online advertisement on smart phone, computer or tablet
10. YouTube video
11. Word of mouth
12. Through an Efficiency Nova Scotia representative during an in-store engagement event
13. Through another Efficiency Nova Scotia program
96. Other [SPECIFY \_\_\_\_\_]
98. Don't know

F3. The day you recently bought the LED light fixture(s), did you see signs or posters in the light fixture section of the store promoting the discount offered on LED fixtures? **[ALLOW ONLY ONE CODE]**

1. Yes
2. No
98. Don't know

## G. Free-Ridership – LED Fixtures

- G1. Efficiency Nova Scotia offered a discount on LED fixtures. Before paying at the cash register, were you aware that a discount was offered on the purchase of LED fixtures? **[ALLOW ONLY ONE CODE]**
1. Yes **[GO TO G3]**
  2. No **[GO TO G2]**
  98. Don't know **[GO TO G2]**
- G2. **[ASK IF NOT AWARE OF THE DISCOUNT (G1=2 OR 98)]** To confirm, you did not know about the discount on specific LED fixtures before paying at the register? **[ALLOW ONLY ONE CODE]**
1. Yes, I knew about the discount
  2. No, I did not know about the discount
- G3. Thinking about your purchase of LED fixtures, what best describes your situation?
1. You were looking to purchase lighting fixtures but not specifically LED
  2. You were looking to purchase LED fixtures before you were aware of the discount offered by Efficiency Nova Scotia
  3. **[ASK IF G1 = 1 OR G2 = 1]** You came to the store to purchase LED fixtures because of the discount offered by Efficiency Nova Scotia
  4. You were not looking to purchase lighting fixtures
  96. Other, SPECIFY: \_\_\_\_\_

**[ASK THE FOLLOWING QUESTIONS IF AWARE OF THE DISCOUNT (G1=1) OR (G2=1), OTHERWISE SKIP TO NEXT SECTION]**

- G4. Were you aware that this would be the last year to take advantage of Efficiency Nova Scotia discounts on LED bulbs?
1. Yes
  2. No
- G5. If the discount of [\$REBATE AMOUNT] on LED fixtures had NOT been offered, what would you have bought? Would you have... **[ALLOW ONLY ONE CODE]**
1. Bought LED fixtures anyway
  2. Bought another type of fixture without LEDs
  3. Not bought any fixtures

G6. **[ASK IF G5=2]** If you were going to purchase a fixture without LED lighting, what type of bulbs would you have installed? **[ALLOW MULTIPLE RESPONSES]**

1. Incandescent
2. Halogen
3. CFLs
96. Other, SPECIFY: \_\_\_\_\_

G7. How likely would you have been to buy the LED fixtures that you purchased if you had to pay the full price? That is, how likely would have you have been to buy the LED fixtures that you purchased if you did not receive the [\$REBATE AMOUNT] discount? Please answer on a scale of 0 to 10, with a 0 indicating that you “Definitely Would Not Have Bought these LED fixtures” and a 10 indicating that you “Definitely Would Have Bought these LED fixtures.” **[DO NOT ACCEPT RANGE]**

99. Prefer not to say

## END

This concludes the survey. As a thank you for your time, we will provide you with a \$20 e-transfer. Please provide your full name and email address to receive the e-transfer. This information will be kept confidential. Incentives will be distributed before or soon after the end of the study in November.

- › Full name:
- › Email Address:
- › I don't wish to receive a e-transfer.
- › Do not have an email address (**DISPLAY THE FOLLOWING ONLY IF “Do not have an email address” RESPONSE IS SEELCTED:** Mailing address for \$20 cheque: \_\_\_\_\_)

## APPENDIX IV

### Instant Savings Participant Survey Results

The tables below present the survey results for Instant Savings from 2021 to 2024. As outlined in the results to A1, respondents in 2021 and 2023 were predominantly participants shopping at non-Costco retailers, 2022 results were from Costco alone and 2024 results were predominantly participants shopping at Costco. This context should be kept in mind when comparing results across years.

#### A. Identification and Screening of Respondent

A1. Where did you purchase your LED bulbs or LED fixtures?

|                    | 2024       | 2023       | 2022       | 2021       |
|--------------------|------------|------------|------------|------------|
| <b>Sample Size</b> | <b>200</b> | <b>122</b> | <b>177</b> | <b>120</b> |
| Costco             | 81%        | 7%         | 100%       | 3%         |
| The Home Depot     | 15%        | 36%        | -          | 55%        |
| Kent               | 5%         | 51%        | -          | 16%        |
| Canadian Tire      | -          | 5%         | -          | 25%        |
| Home Hardware      | -          | 1%         | -          | 2%         |

A2. Please enter the SKU number for the LED bulbs or LED fixtures you recently purchased.

|                    | 2024       | 2023       | 2022       | 2021       |
|--------------------|------------|------------|------------|------------|
| <b>Sample Size</b> | <b>200</b> | <b>122</b> | <b>177</b> | <b>120</b> |
| LED fixture(s)     | 80%        | 34%        | 72%        | 44%        |
| LED bulb(s)        | 21%        | 66%        | 28%        | 56%        |

#### B. Purchase – LED Bulbs

B1. How many non-pear-shaped LED bulbs did you purchase?

|                    | 2024      | 2023      | 2022      | 2021      |
|--------------------|-----------|-----------|-----------|-----------|
| <b>Sample Size</b> | <b>41</b> | <b>81</b> | <b>49</b> | <b>67</b> |
| 1-2                | 15%       | 21%       | 10%       | 39%       |
| 3-4                | 15%       | 48%       | 0%        | 24%       |
| 5-7                | 17%       | 15%       | 16%       | 25%       |
| 8-10               | 34%       | 10%       | 43%       | 7%        |
| 11 or more         | 20%       | 6%        | 31%       | 4%        |
| MEAN               | 6.9       | 4.5       | 9.1       | 4.3       |

Base: Respondents who purchased non-A-type LED bulbs only.  
Don't know/Refused excluded from average calculations

B3. Did you purchase these bulbs for your own use (for example, for your home or cottage)?

|                                                            | 2024      | 2023      | 2022      | 2021      |
|------------------------------------------------------------|-----------|-----------|-----------|-----------|
| <b>Sample Size</b>                                         | <b>41</b> | <b>81</b> | <b>49</b> | <b>67</b> |
| I purchased them for my own use                            | 98%       | 96%       | 98%       | 100%      |
| Others                                                     | 2%        | 4%        | 2%        | 0%        |
| Base: Respondents who purchased non-A-type LED bulbs only. |           |           |           |           |

B4. Are there any non-pear-shaped LED bulbs currently installed in your home (other than those you just bought)?

|                                                            | 2024      | 2023      | 2022      | 2021      |
|------------------------------------------------------------|-----------|-----------|-----------|-----------|
| <b>Sample Size</b>                                         | <b>41</b> | <b>81</b> | <b>49</b> | <b>67</b> |
| Yes                                                        | 71%       | 79%       | 73%       | 79%       |
| No                                                         | 27%       | 16%       | 16%       | 19%       |
| Don't know                                                 | 2%        | 5%        | 10%       | 1%        |
| Base: Respondents who purchased non-A-type LED bulbs only. |           |           |           |           |

B5. You bought one LED bulb. Do you plan on installing it...

B8. [ASK IF B1 (MORE THAN 1 BULB)] You bought [INSERT NUMBER OF LEDS FROM B1] LED bulbs? How many, if any, of these [INSERT NUMBER OF LEDS FROM B1] LED bulbs will be installed...

|                                                | 2024      | 2023      | 2022      | 2021      |

Base: Respondents who purchased non-A-type LED bulbs that were aware of discount prior to purchase

Don't know/Refused excluded from calculations

D9. If the discount had NOT been offered, when would you have purchased the LED bulbs that you did?

|                                      | 2024      | 2023      | 2022      | 2021      |
|--------------------------------------|-----------|-----------|-----------|-----------|
| <b>Sample Size</b>                   | <b>30</b> | <b>40</b> | <b>33</b> | <b>35</b> |
| Earlier                              | 0%        | 0%        | 0%        | 0%        |
| Definitely on the same day           | 13%       | 23%       | 21%       | 60%       |
| Probably on the same day             | 13%       | 28%       | 9%        | 20%       |
| Probably at a later date             | 33%       | 23%       | 33%       | 11%       |
| Definitely at a later date           | 27%       | 10%       | 24%       | 6%        |
| Would not have purchased them at all | 13%       | 18%       | 12%       | 3%        |

Base: Respondents who purchased non-A-type LED bulbs that were aware of discount prior to purchase

D10. Without the discount, would you have definitely purchased the same number of LED bulbs, probably purchased the same number, probably purchased fewer or definitely purchased fewer?

|                            | 2024      | 2023      | 2022      | 2021      |
|----------------------------|-----------|-----------|-----------|-----------|
| <b>Sample Size</b>         | <b>23</b> | <b>29</b> | <b>29</b> | <b>32</b> |
| Definitely the same number | 13%       | 31%       | 10%       | 50%       |
| Probably the same number   | 26%       | 21%       | 17%       | 31%       |
| Probably fewer             | 30%       | 24%       | 41%       | 13%       |
| Definitely fewer           | 30%       | 24%       | 31%       | 6%        |

Base: Respondents who purchased non-A-type LED bulbs that were aware of discount prior to purchase and would have purchased bulbs at some point without discount

D11. You bought [INSERT NUMBER OF LEDS FROM B1 (IF CORRECT) OR B2.2] LED bulbs, what proportion of these bulbs do you expect to install in the next 12 months?

|                    | 2024         |
|--------------------|--------------|
| <b>Sample Size</b> | <b>2 (#)</b> |
| All or nearly all  | 1            |
| Less than half     | 1            |

Base: Respondents who were aware that this would be the last year to take advantage of Efficiency Nova Scotia discounts on LED bulbs and would probably or definitely purchase fewer LED bulbs.

New question in 2024

## E. Purchase – LED Fixtures

E1. How many LED fixtures did you purchase?

|                    | 2024       | 2023      | 2022       | 2021      |
|--------------------|------------|-----------|------------|-----------|
| <b>Sample Size</b> | <b>159</b> | <b>41</b> | <b>128</b> | <b>53</b> |
| 1-2                | 37%        | 54%       | 79%        | 64%       |
| 3-4                | 11%        | 34%       | 13%        | 13%       |
| 5-7                | 13%        | 7%        | 5%         | 6%        |
| 8-10               | 4%         | 2%        | 2%         | 9%        |
| 11 or more         | 34%        | 2%        | 1%         | 8%        |
| MEAN               | 6.7        | 2.8       | 2.1        | 3.3       |

Base: Respondents who purchased LED fixtures

E3. Did you purchase these fixtures for your own use (for example, for your home or cottage)?

|                                                                     | 2024       | 2023      | 2022       | 2021      |
|---------------------------------------------------------------------|------------|-----------|------------|-----------|
| <b>Sample Size</b>                                                  | <b>159</b> | <b>41</b> | <b>128</b> | <b>53</b> |
| I purchased them for my own use                                     | 98%        | 98%       | 97%        | 96%       |
| I purchased them for a client or project outside of my organization | 1%         | -         | 0%         | 2%        |
| Both                                                                | 1%         | -         | 2%         | 0%        |
| Others                                                              | -          | 2%        | 1%         | 2%        |

Base: Respondents who purchased LED fixtures

The wording slightly changes in 2023

E4. Are there any LED fixtures currently installed in your home (other than those you just bought)?

|                    | 2024       | 2023      | 2022       | 2021      |
|--------------------|------------|-----------|------------|-----------|
| <b>Sample Size</b> | <b>159</b> | <b>41</b> | <b>128</b> | <b>53</b> |
| Yes                | 84%        | 80%       | 84%        | 77%       |
| No                 | 15%        | 15%       | 14%        | 17%       |
| Don't know         | 1%         | 5%        | 2%         | 6%        |

Base: Respondents who purchased LED fixtures

E5. Will the LED fixture(s) you bought be installed indoor or outdoor?

|                    | 2024       | 2023*     | 2022       | 2021      |

## APPENDIX V

### Instant Savings Tracking Sheet Audit

This appendix presents the main results of the tracking sheet audit performed by the Evaluator, which was aimed at:

1. Verifying that all data fields required for the evaluation were included and filled out in the tracking sheet submitted by E1
2. Ensuring that tracked results were accurate by:
  - › Verifying that parameters used to calculate program results (gross and net energy and peak demand savings at the generator) were consistent with previous evaluation results
  - › Validating that all calculation steps were performed consistently

Table 1 presents the corrected tracked savings resulting from all changes made by the Evaluator.

**Table 1: 2024 Instant Savings Corrected Tracked Savings**

| Program Component Results                  | Value Tracked by E1 |      | Corrected Tracked Value |      | Relative Difference |
|--------------------------------------------|---------------------|------|-------------------------|------|---------------------|
|                                            | Value               | Unit | Value                   | Unit | Value               |
| <b>Instant Savings</b>                     |                     |      |                         |      |                     |
| Gross Energy Savings at the Generator      | 28.519              | GWh  | 29.151                  | GWh  | 2.2%                |
| Gross Peak Demand Savings at the Generator | 3.477               | MW   | 3.585                   | MW   | 3.1%                |
| Net Energy Savings at the Generator        | 18.925              | GWh  | 19.129                  | GWh  | 1.1%                |
| Net Peak Demand Savings at the Generator   | 2.149               | MW   | 2.206                   | MW   | 2.7%                |

The Evaluator found differences between the tracked and corrected tracked values, which were mainly due to three lighting models having the incorrect product type category and errors in the net energy savings calculation for the ENERGY STAR® certified clothes dryer measure.

## APPENDIX VI

### Instant Savings Algorithms for Free-ridership Calculations

**Table 1: FR Algorithm - LED Bulbs**

| Section 1 – Free-ridership level for those who were unaware of discount before paying                                                                                                                                                                                                                                                                                       |                                                                                               |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------|
| <b>D1.</b> Before paying at the cash register, were you aware that a discount was offered on the purchase of LEDs?                                                                                                                                                                                                                                                          | IF Yes : GO TO Section 2<br>IF No OR REF: GO TO D2                                            |

Retailers were asked to provide sales data for non-A type LED bulbs in advance of their interview. The data provided varied by retailer (e.g., time period, sales or shipments). Therefore, depending on the data provided, for each retailer a series of questions were asked to determine an estimate of the number of all the non-A type LED bulbs sold from January – December 2024(**#LED<sub>Jan-Dec</sub>**).

**Table 2: ME Algorithm - LED bulbs**

|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Accuracy</b>                           | Reflects the proximity of measurements to the true value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Adjustment ratio</b>                   | The ratio of evaluated results to tracked results. This ratio expresses the adjustment made to tracked savings or other tracked values such as effective useful life values.                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Available Demand Response Capacity</b> | The capacity that is available to Nova Scotia Power (NS Power) to reduce system peak demand. This capacity is calculated based on the first two hours of all events called between December and February, excluding weekends and holidays. If an event is shorter than two hours, only the first hour is used to measure available demand response (DR) capacity. Available DR capacity is evaluated on a per-participant basis based on the average demand reduction observed for each event in which the participant was scheduled to participate. E1's total available DR capacity is the sum of each participant's available DR capacity. |
| <b>Baseline</b>                           | To determine gross savings, a baseline (or base case) is established, providing detailed information about the reference (e.g. pre-existing or standard) measure or equipment chosen to be compared with the efficient measure or equipment. For the reference measure or equipment, the baseline may include such information as the hours of operation, wattage, and base consumption.                                                                                                                                                                                                                                                      |
| <b>Bias</b>                               | Systematic deviations of measurements from the true value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Billing calibration</b>                | An activity that consists of adjusting the expected energy savings based on the relative difference between the results of energy simulations and the actual energy consumption of a building or system.                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Confidence interval</b>                | The estimated range of values that is likely to include unknown population parameters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Demand response</b>                    | Demand response measures generate savings in the form of available capacity or a load reduction in response to events called by the electric utility (NS Power) to reduce the load at strategic moments. These events can be called at any time and for any duration, although they are usually called for one to four hours during peak periods.                                                                                                                                                                                                                                                                                             |
| <b>Displaced wattage</b>                  | The displaced wattage is defined as the difference between the wattage values of the baseline equipment or product and that of the efficient equipment or product.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>EnerGuide rating</b>                   | An EnerGuide (official brand of Natural Resources Canada) rating is a standard measure of home energy performance. It is a measure of the efficiency of the building only and does not take into account occupant behaviour. It shows how energy efficient a home is through modelled home heat losses based on several factors including building envelope characteristics, heated volume, heating systems, and air leakage.                                                                                                                                                                                                                 |
| <b>Effective useful life</b>              | The period a measure is expected to be in service and provide both electrical energy and peak demand savings. This value combines equipment life and measure persistence, which includes factors such as business turnover or early retirement.                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Equipment life</b>                     | The number of years installed equipment will operate before it fails.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

|                                         |                                                                                                                                                                                                                                                                                                                                 |
|-----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Equivalent CO2</b>                   | A unit of measurement indicating the amount of carbon dioxide to which various kinds of emitted greenhouse gases are equivalent in terms of warming effects. In this report, gas global warming potential is estimated over a timescale of 100 years.                                                                           |
| <b>Equivalent effective useful life</b> | The number of years by which the first-year savings estimate is multiplied to obtain lifetime energy savings. This value takes into account variations in annual electrical energy savings throughout the effective useful life due to increased baselines.                                                                     |
| <b>Evaluated savings</b>                | Gross and net electrical energy or peak demand savings calculated by the Evaluator using the parameters (unitary savings values, installation rates, interactive effects, net-to-gross ratios, etc.) validated or measured during the evaluation process. Unless otherwise specified, evaluated savings are first-year savings. |
| <b>Evaluation plan</b>                  | The evaluation plan summarizes the program description, objectives, base cases, documentation, evaluation methodology, budget, and schedule.                                                                                                                                                                                    |
| <b>First-year savings</b>               | The first full year of electrical energy or peak demand savings generated by an energy efficiency measure.                                                                                                                                                                                                                      |
| <b>Free-ridership</b>                   | Percentage of gross savings attributable to participants who would have implemented the same or similar energy efficiency measures, with no change in timing, in the absence of the program.                                                                                                                                    |
| <b>Gross savings</b>                    | Change in energy consumption and/or demand that results directly from program-related actions taken by participants in an energy efficiency program regardless of why they participated.                                                                                                                                        |
| <b>Induced consumption</b>              | Energy consumption of appliances that would have been unplugged and not replaced by participants in the absence of the program.                                                                                                                                                                                                 |
| <b>Interactive effects</b>              | Effects on the energy consumption of other systems (such as heating and cooling) in a building due to the installation of an energy efficiency measure.                                                                                                                                                                         |
| <b>In-service rate</b>                  | The proportion of incentivized products installed and operating. This rate is usually applied to programs through which rebates are offered in-store and products are likely to be stored for a certain period before being installed, such as light-emitting diode (LED) lamps.                                                |
| <b>Installation rate</b>                | The proportion of incentivized products reported as installed and that remain installed and operating at the time of evaluation. This rate is usually applied to direct install or mail-in rebate programs through which measures are expected to be installed immediately at the time of participation.                        |
| <b>Lifetime energy savings</b>          | The energy savings that occur over the lifetime of an energy efficiency measure. Lifetime energy savings account for a measure's effective useful life and any increase in the baseline efficiency level (which reduces attributable annual savings) over its lifetime.                                                         |
| <b>Line loss factor</b>                 | The multiplier to convert savings at the customer meter to savings at the utility generator. It accounts for the electrical losses of the transmission and distribution system.                                                                                                                                                 |
| <b>Margin of error</b>                  | The amount of random sampling error.                                                                                                                                                                                                                                                                                            |
| <b>Market effects</b>                   | The impact of a program on the market (in terms of product availability, practices, and prices) and that extends beyond changing program participant behaviours. Market effects include spillover among non-participants.                                                                                                       |

|                                 |                                                                                                                                                                                                                                                                                                                                                             |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Net savings</b>              | Electrical energy or peak demand savings that can be reliably attributed to a program. These include effects such as free-ridership and spillover that negatively or positively affect the savings attributable to a program.                                                                                                                               |
| <b>Net-to-gross ratio</b>       | The ratio of net electrical energy savings to gross electrical energy savings.                                                                                                                                                                                                                                                                              |
| <b>Non-sampling error</b>       | Errors arising during the course of all survey activities other than sampling. Non-sampling errors tend to lead to bias in measurements and are very difficult to quantify.                                                                                                                                                                                 |
| <b>Peak coincidence factor</b>  | The percentage of measure demand savings that coincide in time with the annual peak demand of the entire electricity system.                                                                                                                                                                                                                                |
| <b>Peak demand savings</b>      | The demand savings that coincide in time with the expected annual peak demand period of the entire electricity system. For industrial participants on an interruptible rate, peak demand savings may include savings on non-firm loads, i.e. loads that may be interrupted when NS Power's 10-minute reserve is low.                                        |
| <b>Precision</b>                | The extent to which repeated measurements agree with one another.                                                                                                                                                                                                                                                                                           |
| <b>Random sampling error</b>    | An error in measurement due to the fact that measurements are taken from a subset of the population and not the entire population.                                                                                                                                                                                                                          |
| <b>Realization rate</b>         | The ratio of evaluated savings to tracked savings.                                                                                                                                                                                                                                                                                                          |
| <b>Sample size</b>              | The number of observations or replicates included in a statistical sample.                                                                                                                                                                                                                                                                                  |
| <b>Secondary market impacts</b> | Energy consumption of appliances that would have been transferred to the secondary market if said appliances had not been retired.                                                                                                                                                                                                                          |
| <b>Spillover</b>                | Savings attributable to participants who implement additional energy efficiency measure(s) introduced by a program after participating in it once and without participating in the program a second time.                                                                                                                                                   |
| <b>Tracked savings</b>          | Gross and net savings calculated based on various parameters such as number of participants or units installed or sold, unitary savings values, installation rates, interactive effects, and net-to-gross ratios. Those parameters, with the exception of the number of participants or units installed or sold, are obtained from the previous evaluation. |
| <b>Unitary savings</b>          | Electrical energy or peak demand savings established on a unitary basis. A unit can either be a product (e.g. an 8 W LED lamp), a capacity (e.g. one tonne capacity of an air-source heat pump), or a participant (e.g. one participant taking part in a behaviour-based program).                                                                          |

# EXECUTIVE SUMMARY

This report presents the 2024 demand-side management (DSM) results of the Existing Residential program administered by EfficiencyOne (E1). This program is comprised of seven components: (1) Affordable Multifamily Housing (AMH); (2) Affordable Single-family Homes (ASFH); (3) Efficient Product Installation (EPI); (4) Green Heat; (5) Home Energy Assessment (HEA); (6) Mi'kmaw Home Energy Efficiency Project (MHEEP); and (7) Residential Behaviour. Combined, these program components encourage energy efficiency upgrades in existing residential homes, affordable housing, and non-profit organizations by providing financial incentives, technical information, and recommendations as well as free-of-charge direct installations of energy efficient products.

## Evaluation Approach

The 2024 Existing Residential evaluation was aimed at calculating program component gross and net results, namely electrical first-year and lifetime energy savings, peak demand savings, as well as avoided greenhouse gas (GHG) emissions. Table 1 summarizes the types of evaluation conducted for each program component and the corresponding methodology.

**Table 1: Summary of 2024 Existing Residential Program Evaluation**

| Program Component | Evaluation Type |         |        | Methodology                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## Program Performance

Table 2 below presents the participation levels, NTGRs, evaluated gross and net savings at the generator, annual GHG emission reductions, as well EUL values for each program component and for Existing Residential as a whole.

**Table 2: Overall 2024 Existing Residential Participation and Evaluated Savings**

| * The average NTGR values presented in this table correspond to the ratios of net savings to gross savings by program component and then for the entire program. |                     |                        |               |                  |        |             |                  |

Existing Residential was aimed at achieving 46.523 GWh in net electrical energy savings and 11.495 MW in net peak demand savings at the generator for 2024. The program was able to achieve planned energy and peak demand savings. AMH, EPI, Green Heat, MHEEP and Residential Behaviour fell below their energy targets, while ASFH and HEA exceeded theirs. AMH, EPI and Green Heat also fell below their peak demand targets, while ASFH, HEA and MHEEP exceeded theirs. AMH, ASFH, HEA and MHEEP participation levels reached their highest point in 2024, while Residential Behaviour was launched in 2024. HEA was the largest contributor to total program net energy (60%) and peak demand savings (61%).

The following subsections present evaluation results at the program component level.

## AMH Findings and Recommendations

This subsection presents the key findings and recommendations from the 2024 AMH evaluation.

**2024 AMH-Finding:** AMH generated high levels of satisfaction overall. Interviewed participants were highly satisfied with AMH and “would definitely” recommend the program. Energy Auditors (EAs) were also satisfied with AMH overall, particularly with the selection of upgrades. Everyone agreed that the program is simple to understand and easy to complete.

**2024 AMH-Finding:** AMH incentive calculations can cause confusion among participants. Participants do not always realize that they must pay tax on overall project expenditures and that the program component only covers up to 80% of pre-tax costs.

**Recommendation #1:** To further aid understanding, consider providing participants with case study examples of incentive calculations to show pre-tax costs and how incentive amounts may change based on supplier quotes and/or equipment installed.

**2024 AMH-Finding:** Some participants would benefit from project management support. Based on comments from E1, EAs, and participants, project management assistance, technical/maintenance support, and help finding contractors would be useful for participants.

**Recommendation #2:** Ensure that support and handholding are available for participants who may need help navigating the program component and finding various contractors. Make technical guides available, providing general advice to help participants through the program component.

**2024 AMH-Finding:** Among EAs, satisfaction is low with the audit reporting templates.

**Recommendation #3:** Investigate the possibility of improving the audit reporting templates to improve time efficiencies for EAs, for example by streamlining the reports as much as possible.

**2024 AMH-Finding:** Costs and lack of budget are barriers to participation. The majority of dropped-out participants had no budget available for building maintenance and efficiency upgrades, a situation that was echoed among most interviewed non-participants and half of AMH participants.

**Recommendation #4:** In the early stages of participant engagement, ensure that participants are aware of the co-financing options listed in E1's agreement.

**2024 AMH-Finding:** Rental rates in the operating agreement cause division among dropped-out participants and non-participants. Negative perceptions were due to rental rates in the agreement being lower than what dropped-out participants and non-participants currently charge; they were therefore a barrier to program participation. E1 regularly reviews rental rates basis to align with current market conditions.

**2024 AMH-Finding:** Term lengths are not a significant problem. No participants, dropped-out participants, or non-participants expressed significant concern about AMH term lengths.

**2024 AMH-Finding:** In 2024, AMH achieved 1.159 GWh in net electrical energy savings and 0.570 in net peak demand savings at the generator, falling short of planned net electrical energy savings of 1.900 GWh by 39% and planned net peak demand savings of 1.581 MW by 64%.

**2024 AMH-Finding:** Despite a slight increase (5%) in participation compared to 2023, AMH achieved lower savings than in 2023. In total, 83 projects (64 prescriptive and 19 comprehensive) generated electrical savings in 2024. Together, AMH paths generated 21% and 23% fewer electrical energy and peak demand savings respectively compared to 2023.

**2024 AMH-Finding:** Following project reviews, the Evaluator made an overall upward adjustment to electrical energy savings and a downward adjustment to peak demand savings. For electrical energy savings, a small upward adjustment ratio applied to prescriptive heat pump projects was almost cancelled by a one-time downward adjustment from comprehensive projects. For peak demand savings, one-time adjustments were calculated for both prescriptive lighting and comprehensive projects.

**2024 AMH-Finding:** The net evaluated electrical energy savings were nearly the same as the energy savings tracked by E1 and the net evaluated peak energy savings were 2% lower than the peak demand savings tracked by E1. These differences are due to the adjustments applied by the Evaluator following the project reviews.

## ASFH Findings and Recommendations

This subsection presents the key findings and recommendations from the ASFH evaluation in relation to the above objectives.

**2024 ASFH-Finding:** The energy efficient retrofits installed at no cost through ASFH are perceived by participants to be making their homes more comfortable and warmer in winter and less expensive to heat.

**2024 ASFH-Finding:** Surveyed participants, interviewed DAs and heat pump contractors are generally satisfied with ASFH. Participants consider it easy and worthwhile to participate and would highly recommend the program to others. Although DAs and contractors make suggestions for improvements to the program, they widely agree that it is worthwhile being involved.

**2024 ASFH-Finding:** Although satisfaction is good overall, long wait times cause discontent at various program stages and for various stakeholders (participants, DAs, and heat pump contractors). E1 is cognisant of dissatisfaction with wait times. They report that they have expanded the number of staff members and are catching up with the backlog.

**Recommendation #1:** To assess progress with participant wait times, E1 could track wait times as well as program delivery satisfaction levels (e.g. in quarterly customer satisfaction surveys) throughout 2025 to determine how strategies are performing and make adjustments if necessary.

**2024 ASFH-Finding:** Limited participant knowledge about ASFH can cause participant confusion and frustration during the initial DA/contractor visit, particularly if participants are considering taking part in multiple programs (such as ASFH and OHPA).

**Recommendation #2:** Provide participants with more information about ASFH to help them understand program options, eligible measures, and participation steps by implementing the following:

- a) Investigate ways to inform participants about eligible measures in ASFH and to ensure that other program options and their differences (i.e. Oil to Heat Pump Affordability [OHPA]) are clearly presented to participants verbally and through marketing materials.
- b) Review the application template for clarity and adapt it to confirm with participants to which program they are applying (i.e. ASFH, OHPA). Ensure that the information in the application is shared with DAs/contractors.
- c) Once participants have submitted their application, clearly communicate (perhaps using a visual) the touchpoints that will occur along their journey (e.g. who will be contacting them, at what point, and what to expect).

**Recommendation #3:** Reinforce participant awareness of the Energy Solution Advisor's role as E1 program navigator to help participants better understand and navigate E1's programs (including ASFH).

**2024 ASFH-Finding:** Some participants say they did not receive information about the products installed and some still have doubts about how to operate and maintain their new equipment (especially heat pumps) even though contractors report reviewing this with participants after installation.

**Recommendation #4:** To maximize energy savings, ensure that all participants receive the necessary information to operate and maintain the equipment installed in language that is easy to understand. Implement checklists for DAs and heat pump contractors if necessary.

**Recommendation #5:** Ensure that DAs/contractors provide a leave-behind so that participants know who to contact in case of questions or difficulties or to better understand how to operate and maintain their heat pump.

**2024 ASFH-Finding:** Having to use two platforms for filling out the required record keeping/reporting forms (CIS) and uploading documentation (SharePoint) is said to lead to repetitive data entry and unclear requirements for DAs and heat pump contractors. Furthermore, DAs report many changes since the original training on processes and system use, which have never been formally communicated and lead to a lot of back and forth with E1 to resolve issues.

**Recommendation #6:** Look for opportunities to streamline record keeping/reporting processes to reduce the administrative burden for DAs and contractors, taking into account program tracking and evaluation needs.

**Recommendation #7:** Update the DA/contractor training guides on the record keeping/reporting processes and use of the software tools to reflect current practices and offer regular training sessions to provide updates on any changes.

**2024 ASFH-Finding:** ASFH achieved 3.719 GWh in net electrical energy savings and 2.089 MW in net peak demand savings at the generator in 2024, exceeding the planned electrical energy and peak demand savings targets by 32% and 100% respectively .

**2024 ASFH-Finding:** In 2024, 1,210 homes participated in ASFH, nearly five times the number recorded in 2023. While gross electrical energy and peak demand savings were respectively 158% and 233% higher than in 2023 primarily due to increased participation, average savings per participant decreased by 48% due to updated adjustment ratios and a higher number of projects with only non-modelled measures.

**2024 ASFH-Finding:** The evaluated net electrical energy and peak demand savings determined by the Evaluator were respectively lower by 21% and 3% compared to the net savings tracked by E1. These lower savings were mainly due to the new adjustment ratios.

## EPI Findings and Recommendations

This section provides the Evaluator's key findings and recommendations in relation to the above objectives.

**2024 EPI-Finding:** Participants are highly satisfied with the overall program component.

**2024 EPI-Finding:** With 8.948 GWh in net electrical energy savings and 0.880 MW in net peak demand savings at the generator in 2024, EPI net electrical energy and peak demand savings were under targets by 15% and 22% respectively.

**2024 EPI-Finding:** While participation increased by 2% in 2024, average electrical energy savings per participant decreased by 6.3%. This reduction in savings per participant was mainly due to the update to the 2024-2025 DSM MA, notably downward adjustments to smart thermostat and LED lamp unitary savings that respectively represented around 27% and 43% of EPI electrical energy savings in 2024.

**2024 EPI-Finding:** Based on 2024 on-site visit findings, installation rates for most products remained relatively stable. One notable exception was smart thermostats for MSHPs, for which an 84% installation rate was established, which represents a 16% reduction compared to the tracked value.

**Recommendation #1:** To improve the smart thermostat installation rate, explore and implement strategies to reduce the number of participants disconnecting this product due to dissatisfaction. For example, follow-up calls could be conducted, installers could educate more participants on this product, or additional educational material on this product could be shared with participants.

**2024 EPI-Finding:** The overall NTGR value remained stable compared to the 2023 level, although per-product NTGR values varied more significantly. This is due to the increase of the NTGR value for LED lighting being cancelled out by the decrease of the NTGR value for smart thermostats.

**2024 EPI-Finding:** The evaluated net electrical energy savings were 6% lower than the tracked net electrical energy savings, while the evaluated net peak demand savings were 1% higher than the tracked net peak demand savings. The main reasons for this difference are the impact of the downward update to the installation rate for smart thermostats for MSHPs and the hours of use value for LED lamps, the two largest contributors to EPI electrical energy savings in 2024. Since those two changes did not impact peak demand savings, the evaluated net peak demand savings were not similarly reduced.

**2024 EPI-Finding:** The jurisdictional scan revealed several appropriate products to be considered for the EPI electrician-installed measure offer, namely advanced heat recovery ventilator controls, bathroom fans, block heater timers, and heat reflector panels or rolls.

## Green Heat Findings and Recommendations

**2024 Green Heat-Finding:** Green Heat fell short of its net savings targets, achieving 24% and 55% of its electrical energy and peak demand targets respectively.

**2024 Green Heat-Finding:** Green Heat participation decreased for the third consecutive year, particularly for MSHPs (19% reduction) and demand reduction measures (36% reduction). The decrease is attributed to the launch of the CGH Grant in May 2021, which led to participants choosing HEA over Green Heat. Since the CGH Grant was closed to new applicants on February 5, 2024, it is possible that Green Heat participation will increase once again in the upcoming years.

**2024 Green Heat-Finding:** Both the evaluated gross electrical energy and peak demand savings were significantly lower than the savings tracked by E1. The results of the billing analysis conducted as part of the 2024 evaluation led to significant changes to gross electrical energy and peak demand savings parameters and calculations for MSHPs and biomass measures, which resulted in low realization rates of 35% and 71% for net electrical energy savings and net peak demand savings respectively.

**Recommendation #1:** In light of their very low savings and considering their low uptake, consider removing wood fireplace inserts and pellet fireplace inserts from the Green Heat offer.

**2024 Green Heat-Finding:** The nil electrical energy savings found for mainly electrically heated households as part of the billing analysis suggest that the increase in electricity consumption due to transferring a portion of the heating consumption from wood or oil to an electric heat pump cancels out the electricity savings

achieved by replacing some electric resistance heating by a heat pump. While DSM savings only consider electrical savings, there are most likely other fuel savings occurring for these participants.

## HEA Findings and Recommendations

**2024 HEA-Finding:** HEA net electrical energy savings exceeded the target of 19.012 GWh by 68%, and the planned net peak demand savings of 4.799 MW by 81%.

**2024 HEA-Finding:** With 5,367 projects, the 2024 participation level was the highest observed for HEA since the program component was launched. The average gross energy savings per home was 7,264 kWh, a slight decrease of 3% compared to 2023, which was the highest record observed for HEA. The integration of the CGH Grant into HEA contributed to the historically high participation rate and gross savings per participant. With the closure of the CGH Grant to new applicants in early 2024, a decrease in both participation and energy savings is expected in upcoming years.

**2024 HEA-Finding:** The evaluated energy and peak demand savings were 8% and 62% higher than the savings tracked by E1 respectively. A new billing analysis was conducted as part of this evaluation and changes were made to the savings calculation approach to make it more robust. In anticipation of these changes, E1 applied an additional adjustment ratio to their tracked energy savings, which allowed E1 to track energy savings close to the evaluation results. E1 also applied the additional adjustment ratio to their tracked peak demand savings, but since the billing analysis results did not impact the peak demand savings calculation for mini-split heat pumps, the evaluated peak demand savings were higher than those tracked by E1. Unitary electrical energy and peak demand savings for wood and pellet stoves and fireplace inserts were also updated based on the Green Heat billing analysis results. Distinct unitary savings values were determined for stoves and fireplaces, with fireplaces having very low savings.

**Recommendation #1:** In light of their very low savings and considering their low uptake, consider removing wood fireplace inserts and pellet fireplace inserts from the HEA offer.

**2024 HEA-Finding:** Parameters used to calculate unconverted D assessment spillover were reassessed by compiling the results of 19 site visits completed by EAs among surveyed expired participants and remain relatively stable.

## MHEEP Findings and Recommendations

This subsection presents the key findings from the MHEEP evaluation. The Evaluator has no specific recommendation for MHEEP.

**2024 MHEEP-Finding:** MHEEP net electrical energy savings fell short of targets by 35%, while peak demand savings exceeded targets by 189%.

**2024 MHEEP-Finding:** While MHEEP achieved the highest participation since its inception with an increase of 19%, the average energy savings per participant decreased by 41%, generating 31% lower gross energy savings and 29% higher gross peak demand savings in 2024 compared to 2023 levels.

**2024 MHEEP-Finding:** The evaluated net energy and peak demand savings were 31% lower and 15% higher than the values tracked by E1 respectively. This was mainly due to revisions to the adjustment ratios and to peak demand savings per capacity value for heat pumps.

## Residential Behaviour Findings and Recommendations

This subsection presents the key findings from the 2024 Residential Behaviour evaluation. The Evaluator has no specific recommendation for Residential Behaviour.

**2024 Residential Behaviour-Finding:** Residential Behaviour achieved 6.270 GWh in net electrical energy savings in 2024, thus falling short of its net electrical energy savings targets of 8.000 GWh. This outcome is not surprising since the program is still in its ramp-up phase after only 8 months of implementation. With achieved savings percentages ranging from 0.87% to 1.3% in the fall of 2024 depending on the wave, results are promising and indicate that the program component has potential for greater savings as it is scaled up.

**2024 Residential Behaviour-Finding:** The composition of the control and treatment groups remained similar between the initial selection (March 2024) and program component launch (May 2024). Over the first year of evaluation, 13,439 eligible Nova Scotia Power residential customer accounts either became inactive (i.e. customers closed their accounts or moved) or ineligible to continue participating as they installed solar photovoltaic systems, no longer offering a valid billing analysis comparison to non-solar customers. The attrition rate for high and medium electricity consumption users was 5.2% between May 2024 and December 2024 while it was 7.0% for low electricity consumption users.

**2024 Residential Behaviour-Finding:** Treatment group customers showed higher participation in other residential programs compared to the control group. Residential Behaviour successfully encouraged treatment participants to engage in other residential programs.

## Program Tracked and Evaluated Savings

Table 3 below compares E1 tracked electrical energy and peak demand savings to evaluated savings at the generator. It also includes the realization rate, representing the ratio of evaluated net savings to tracked net savings, for both energy savings and peak demand savings. The NTGRs are also presented and correspond to the rounded averages obtained by dividing net savings by gross savings, which explains why the values are different from those presented in the other sections. Residential Behaviour relies on a random selection of treatment group participants among all residential customers; therefore, the program component does not have a tracking sheet and there is no realization rate.

**Table 3: Comparison of 2024 Tracked and Evaluated Savings at the Generator**

|            |                       | Gross Savings |      | NTGR | Net Savings |      | Realization Rate |
|------------|-----------------------|---------------|------|------|-------------|------|------------------|
|            |                       | Value         | Unit |      | Value       | Unit |                  |
| AMH        | Energy Savings        |               |      |      |             |      |                  |
|            | Tracked Savings by E1 | 1.158         | GWh  | 1.00 | 1.158       | GWh  | 100%             |
|            | Evaluation Results    | 1.159         | GWh  | 1.00 | 1.159       | GWh  |                  |
|            | Peak Demand Savings   |               |      |      |             |      |                  |
|            | Tracked Savings by E1 | 0.580         | MW   | 1.00 | 0.580       | MW   | 98%              |
|            | Evaluation Results    | 0.570         | MW   | 1.00 | 0.570       | MW   |                  |
| ASFH       | Energy Savings        |               |      |      |             |      |                  |
|            | Tracked Savings by E1 | 4.693         | GWh  | 1    | 4.693       | GWh  | 79%              |
|            | Evaluation Results    | 3.719         | GWh  | 1    | 3.719       | GWh  |                  |
|            | Peak Demand Savings   |               |      |      |             |      |                  |
|            | Tracked Savings by E1 | 2.160         | MW   | 1    | 2.160       | MW   | 97%              |

## INTRODUCTION

EfficiencyOne (E1), an independent, non-profit organization, is responsible for helping Nova Scotians improve the energy efficiency of their homes and workplaces by designing, marketing, and delivering demand-side management (DSM) for Nova Scotians. E1 provides energy efficiency, demand response and carbon mitigation services through the Efficiency Nova Scotia (ENS) franchise. Regulatory oversight of its DSM activities is provided by the Nova Scotia Utility and Review Board (NSUARB). E1 receives funding for its electricity DSM activities from Nova Scotia Power (NS Power) ratepayers.

E1 has a DSM portfolio of three residential programs, three business, non-profit, and institutional (BNI) programs, and one demand response (DR) program that are marketed to Nova Scotians through the ENS franchise. Each program has one or more program components. Econoler was commissioned by E1 to evaluate E1's 2024 DSM program portfolio.

This evaluation report relates to the Existing Residential program comprised of seven components: Affordable Multifamily Housing (AMH); Affordable Single-family Homes (ASFH); Efficient Product Installation (EPI); Green Heat; Home Energy Assessment (HEA); Mi'kmaw Home Energy Efficiency Project (MHEEP); and Residential Behaviour. Table 4 below lists the Existing Residential program components and the types of evaluations conducted for 2024. A comprehensive impact evaluation involves reviewing the following four key elements: (1) The baseline definition; (2) the savings calculation methodology; (3) the values of the parameters used to calculate savings; and (4) NTGRs. A condensed impact evaluation involves using some or all of the previous year's impact evaluation parameters such as unitary savings values, adjustment ratios, installation rates, and NTGRs to provide evaluated results.

**Table 4: Types of Evaluations Conducted for Each Program Component, 2024**

| Program              | Program Component     | 2024    |        |                            |
|----------------------|-----------------------|---------|--------|----------------------------|
|                      |                       | Process | Market | Impact                     |
| Existing Residential | AMH                   | X       |        | Comprehensive              |
|                      | ASFH                  | X       |        | Condensed                  |
|                      | EPI                   |         | X      | Comprehensive              |
|                      | Green Heat            |         |        | Comprehensive              |
|                      | HEA                   |         |        | Comprehensive <sup>1</sup> |
|                      | MHEEP                 |         |        | Condensed                  |
|                      | Residential Behaviour |         |        | Comprehensive              |

For each program component, the Evaluator prepared a DSM evaluation report presenting key findings, electrical first-year and lifetime energy savings, peak demand savings, and avoided greenhouse gas (GHG) emissions.<sup>2</sup>

<sup>1</sup> Does not include update to NTGRs.

<sup>2</sup> Unless specified otherwise, electrical energy savings refer to first-year energy savings rather than lifetime energy savings throughout this report.

# 1 AMH Overview

This section describes Affordable Multifamily Housing (AMH), follows up on past evaluation recommendations, and provides an overview of AMH participation history.

## 1.1 AMH Description

AMH provides affordable housing owners and non-profit organizations, such as rehabilitation or transition houses, with incentives for building-wide energy retrofit projects with the intent of reducing electrical and non-electrical energy consumption in Nova Scotia. Unless they follow a prescriptive path to install specific measures, AMH projects must undergo a complimentary energy audit at the beginning of the participation process to identify eligible energy efficiency measures such as water and space heating systems and building envelope measures. The audit is conducted by one of five AMH-approved EAs. Further details about the AMH participation process are provided in Figure 1.

**Figure 1: AMH Participation Process Summary**

\* The CIRx Screening Tool is an E1 tool presenting the savings calculation methodologies, assumptions, and equipment parameters specific to each project.

Since 2021, AMH savings have been generated through two project paths, the comprehensive path and prescriptive path.

- › Comprehensive path projects serve to implement measures that are modelled in HOT2000, RETScreen, or CANQuest. Energy savings from comprehensive projects are calculated by comparing the energy models of a base case and a proposed case. Calculations are performed with project-specific parameters.
- › Prescriptive path projects are not modelled because their energy savings are calculated using the CIRx Screening Tool provided by E1, which is a tool presenting the savings calculation methodologies, assumptions, and calculation parameters for measures implemented under AMH.

In July 2023, the maximum incentive amounts were changed from \$15,000 to \$17,254 per affordable unit (multi-unit residential buildings [MURBs] and cooperatives) and from \$5,000 to \$5,751 per affordable room (rooming houses). The maximum rebate was amended in December 2022 to \$300,000 for all building types.

AMH funding comes from two sources: (1) Electricity ratepayer funding is used for measures that reduce electricity consumption; and (2) funding from the Province of Nova Scotia (PNS) is used for measures that reduce non-electrical fuel consumption as well as a portion of upgrades that reduce electricity consumption. Since April 2021, additional funding from Province of Nova Scotia through the Green Fund allows for an increase in the incentive amount of up to 80% of costs for electrical projects in residential properties and up to 100% in shelters and transition houses. This report presents all electrical savings achieved through AMH and allocated to DSM funding.

AMH was aimed at achieving 1.900 GWh in net electrical energy savings and 1.581 MW in net peak demand savings at the generator in 2024.

## **1.2 Follow-up on Past Evaluation Report Recommendations**

No recommendations were made for AMH in the 2023 evaluation.

## **1.3 Participation History**

Since 2021, AMH savings are generated by two types of projects, namely comprehensive and prescriptive projects. In 2024, 83 projects generating electrical energy savings were completed under AMH, including 19 comprehensive and 64 prescriptive projects, which resulted in 1.159 GWh in gross electrical energy savings and 0.570 MW in gross peak demand savings at the generator.

As illustrated in Figure 2 below, the number of projects in 2024 was similar to 2023, with a small increase of 5%. More precisely, the number of prescriptive projects decreased from 68 projects in 2023 to 64 in 2024, while the number of comprehensive projects increased from 11 to 19. The large increases in the number of participants observed in 2022 and 2023 were due to the inclusion of prescriptive heat pump projects, and this trend appears to have stabilized.

As observed in Figure 2 below, energy savings per project considerably vary from year to year mostly due to the various building sizes included in AMH. In 2024, electrical energy savings per prescriptive project decreased compared to 2023 while they slightly increased for comprehensive projects.

**Figure 2: Overview of AMH Participation, 2018-2024**

Figure 3 below presents the evolution of AMH gross savings since 2018. Again in 2024, prescriptive projects generated the most electrical energy savings (80%) and the most peak demand savings (88%).

Despite a slightly larger number of overall projects compared to 2023, gross electrical energy and peak demand savings decreased by 21% and 23% respectively mostly due to the lower average savings per prescriptive projects.

**Figure 3: Evolution of AMH Gross Savings at the Generator, 2018-2024**

## 2 AMH Evaluation Approach

The 2024 AMH evaluation comprised a comprehensive impact evaluation as well as a process evaluation. The main objectives of the 2024 AMH evaluation were as follows:

- › Collect information on participant and EA perspectives
- › Calculate AMH gross and net results, namely electrical first-year and lifetime energy savings, peak demand savings, as well as avoided GHG emissions

The Evaluator identified key research questions aimed at achieving the above objectives. Table 5 outlines the evaluation objectives and maps them to the Evaluator's research questions, methods, and sample sizes (n). Each method is described further below.

**Table 5: 2024 AMH Evaluation Approach**

| Evaluation Objectives                                                  | Research Questions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Methodology                                                                                              |

## Tracking Sheet Audit

Prior to performing the unitary savings review, the Evaluator performed an audit of the final 2024 tracking sheet to ensure it was complete and the entered data were consistent. The results obtained are presented in Appendix I.

## Energy Auditor Interviews

In October and November 2024, Narrative Research conducted interviews with four EAs involved in AMH to obtain their perspectives on the program component and to assess its perceived effectiveness. The guide used for the EA interviews is presented in Appendix II.

## Participant Interviews

A total of 10 AMH participants composed of seven (n=7) prescriptive path participants and 3 (n=3) comprehensive path participants took part in a telephone interview administered by Narrative Research in October and November 2024. Six participants were multi-unit residential building (MURB) owners, four of which had one to three units and two of which had four or more units. Of the remaining four participants, three buildings were non-bed facilities and one was a shelter. The phone interviews lasted on average approximately 21 minutes. The aims of the interviews were to understand motivations for participating and perspectives on the program component. The interview guide used is presented in Appendix III.

## Dropped-out Participant Interviews

In October and November 2024, Narrative Research conducted six telephone interviews among participants who started the program but did not complete the participation process (hereafter referred to as dropped-out participants). All six interviewed dropped-out participants were from the AMH comprehensive path, four had MURBs and two had non-bed facilities. It should be noted that two partial interviews were also conducted with two prescriptive path dropped-out participants. For various reasons, those interviews could not be completed; where possible, the results from the interviews with those two dropped-out participants are included in the analysis. The aims of the six interviews were to understand motivations for dropping out and barriers to participation in the program component. The interview guide used is presented in Appendix IV.

## Non-participant Interviews

In October and November 2024, Narrative Research conducted 10 telephone interviews with customers who had contacted E1 to obtain information about the program component but decided not to take part. Six participants were from the comprehensive path and six from the prescriptive path. Four participants were associated with MURBs, four with rental/co-operative units, and one with a rooming house. The aims of the interviews were to understand reasons for initial interest and barriers to participation in the program component. The interview guide used is presented in Appendix IV.

## Desk Reviews with Participant Interviews

In October and November 2024, the Evaluator reviewed the documentation of 10 prescriptive projects, and LMMW Group Ltd performed simulation model reviews for five comprehensive projects. For comprehensive projects, the simulation model reviews were aimed at validating that the inputs used in the simulation model were appropriate and the savings tracked by E1 were consistent with the simulation outputs. For prescriptive projects, the desk reviews were aimed at validating the consistency of the savings tracked by E1 with the calculations, photos, and invoices included in project files. The protocol used for the desk and simulation model reviews is presented in Appendix V.

## EUL Update

Using the effective useful life (EUL) values for common measures presented in the 2024-2025 Demand-side Management Measure Assessment<sup>3</sup> (DSM MA) and the proportions of savings generated by individual measures implemented through AMH in 2024, the Evaluator calculated an average EUL for comprehensive projects. The EUL value of each measure was used for prescriptive projects based on EUL values from the 2024-2025 DSM MA.

## Calculations Using Evaluation Results

Building on all the above methods and collected data, the Evaluator calculated the first-year and lifetime energy and peak demand savings as per the calculation methodology presented in Subsection 4.2 below.

## GHG Emission Reduction Calculations

To obtain net avoided GHG emissions in CO<sub>2</sub> eq for AMH, the Evaluator multiplied the net energy savings by the latest Nova Scotia-specific factor for GHG emissions generated by electricity production. This factor was established using Nova Scotia Power (NS Power) data.

### Note on Margins of Error

For evaluation activities that yield quantitative results based on a sample, the Evaluator aimed to achieve a maximum margin of error of 10% at a confidence level of 90%. This means that, if measurements were conducted many times with different samples, the data would be within 10 percentage points above or below the percentage reported 90% of the time. Thus, the margin of error indicates the relative level of precision<sup>4</sup> of a measurement, while its associated confidence level indicates the probability of a measurement falling within the margin of error.<sup>5</sup>

As part of the 2024 AMH evaluation, the Evaluator calculated the margins of error for adjustment ratios. The margins of error are listed alongside results in the applicable sections below. Examples of calculations used to establish margins of error are provided in Appendix II of the 2024 DSM Programs Evaluation Executive Summary.

---

<sup>3</sup> The 2024-2025 DSM MA is a reference document that provides an in-depth review of all parameters necessary to calculate the annual and lifetime gross energy and peak demand savings of most prescriptive measures and some semi-prescriptive measures offered through E1's DSM program portfolio. In addition, the Measure Assessment includes effective useful life values for all measures offered in E1's program portfolio. For the evaluations conducted during the last two years of the 2023-2025 DSM cycle, the Evaluator refers to the values presented in the 2024-2025 DSM MA.

<sup>4</sup> Precision refers to how reproducible a set of measurements is. It does not take into account how close the measured values are to the true values since this would refer to accuracy.

<sup>5</sup> As part of this evaluation, the confidence levels and margins of error only take random sampling errors into account; they do not reflect non-sampling errors or biases such as data entry errors, inaccurate responses from respondents, or the inability to contact certain people.

### 3 AMH Stakeholder Perspectives

This section presents an analysis of stakeholder perspectives on AMH. Stakeholders include AMH participants, dropped-out participants, non-participants, EAs, and E1 staff. It should be noted that, due to the small sample size for these targets, results are provided as numbers of participants rather than percentages.

#### 3.1 Awareness About AMH

##### 3.1.1 Sources of Program Awareness

Participants, dropped-out participants, and non-participants quoted various sources of AMH program awareness. The most common sources among **participants** were **word-of-mouth** from a colleague, friend, or family member, a **contractor** having informed them of the program, and **traditional media** (that is, radio, TV, print, etc.). For **dropped-out** participants, the top source of AMH awareness was an **E1 advisor** or staff member; for **non-participants**, the top source was the **ENS website** or a general online search. Other mentions across the three participant types included social housing associations, different levels of government, and an ENS email communication. There were no notable differences between how comprehensive versus prescriptive participants became aware of AMH.

**Figure 4: Sources of Program Awareness (Unaided)**

The majority of AMH participants (8/10) and dropped-out participants (6/8) were **unaware of the prescriptive and comprehensive paths** of the program component. Surprisingly, more non-participants reported being aware of the two paths (6/10) than participants and dropped-out participants. It should be noted that E1 staff make participants who apply for the prescriptive path and are eligible for the comprehensive path aware of the latter option. Participants who are only eligible for the prescriptive path due to building size are automatically steered toward that path; therefore, the two paths are not necessarily identified or explained to all participants.

The two AMH participants who recalled that there were two paths both correctly identified that they were enrolled in the prescriptive path and were able to provide an accurate description of the differences between the two pathways, albeit with different levels of detail.

## 3.2 Motivations and Barriers to Participation

### 3.2.1 Motivations for Participating in AMH

Cost savings were the primary motivator for participating in AMH with seven out of 10 mentioning **the rebates offered**, and six of 10 mentioning **saving money on energy bills**. Reasons for taking part cited less frequently included wanting to **improve tenant comfort**, the **energy efficiency measures offered**, and the desire for **a more energy efficient building**. Wanting a heat pump, reducing GHG emissions, and participating in AMH “just making sense” were cited by one participant each.

**Figure 5: Reasons for Participation (Unaided)**

Two out of the five EAs believed that the AMH rebates enable some participants, most likely not-for-profit organizations, to continue to offer affordable housing and keep their rent low. EAs reported that, to some extent, interest in reducing GHG emissions is often factored into a participant’s decision, although it is not considered a primary motivation.

### 3.2.2 Reasons for Initial Interest Among Dropped-out Participants and Non-participants

As seen above among participants, when it comes to why dropped-out participants and non-participants were initially interested in AMH, cost-related factors were again the primary draw; six dropped-out participants and seven non-participants mentioned the **rebates/financial support** offered through AMH (see Figure 6 below). Less frequently mentioned reasons for being interested in AMH among these two groups also aligned with participants’ motivations and include wanting to have a **more efficient building**, **saving money on energy bills**, the **energy efficient measures offered** through the program component, and improved tenant comfort.

**Figure 6: Reasons for Initial Interest Among Dropped-out Participants and Non-participants (Unaided)**

Both dropped-out participants and non-participants generally had **undefined expectations regarding the benefits they thought they would receive from participating** in AMH. While expectations broadly centered around receiving **some form of financial support** for energy efficiency upgrades (and the subsequent financial savings those upgrades would offer), few had set expectations as to what amount would be offered. Three interviewees specifically noted that they expected to receive up to the promoted 80% rebate offered.

Similarly, while six interviewees noted a particular interest in receiving **rebates for heat pumps** and two had interest in receiving funding for insulation and/or windows when first exploring participating in AMH, none had firm expectations as to the extent or type of upgrades specifically covered in AMH. One dropped-out participant specifically noted that their expectations were tempered due to negative past experiences with other rebate programs.

### 3.2.3 Barriers to Participation and Program Completion

For the dropped-out participants who started but did not complete the program component, **financial barriers** were cited most often as reasons for dropping out of AMH. Dropped-out participants noted they **did not have the budget available** to cover their portion of the costs (n=5), including the upfront costs, while waiting for the first part of the incentive, **did not realise how much the upgrades would cost** (n=3), or felt the **incentives were too low** (n=2). **Too long of a payback period** was also cited as a contributing factor (n=1).

Half of dropped-out participants (n=4) noted their decision not to proceed was due, at least in part, to **issues with the operating agreement/affordability covenant**.<sup>6</sup> Specifically, all four felt **the rental rate amounts were too low**. E1 staff reported that dissatisfaction with the rental rates were one of the main reasons they were seeing for participants not continuing with AMH. Although rates are updated every year, rates may still be too low especially with high upfront costs and participants having to commit to a long-term agreement. (See Subsection 3.3.5 below for further information on the affordability covenant.)

Less frequently mentioned reasons for dropping out include **program ineligibility** (finding out their building was not eligible for AMH), **the desired upgrades not being included in the program** (e.g. roof repairs, electric panel upgrades), and **problems related to the renovation work** (e.g. difficulty in finding a contractor). Each of these mentions was cited as a contributing factor, albeit to varying degrees, by at least one dropped-out participant. EAs added that older buildings may require preparation work (e.g. electrical panel upgrade, fixing leaking roof) before the recommended upgrades are completed, with the costs of the work being a barrier to AMH participation if those costs are not covered under the program component.

Two dropped-out participants cited external factors for not proceeding. Specifically, one noted they were currently deciding whether or not to sell the property and therefore were not in a position to sign the operating agreement, while the other dropped out due to illness. Of note, in the latter case, the dropped-out participant expressed interest in reapplying to AMH in the near future.

All dropped-out participants reported withdrawing from the program after completing the application form, but before signing the operating agreement/affordability covenant, with one exception who was unable to confirm at what specific step along the process they dropped out of AMH.

---

<sup>6</sup> The operating agreement requires that the participant resolve all necessary health and safety repairs to the building before the energy efficiency work is undertaken and maintain rental rents at or below those established through AMH for a period of 12 (comprehensive path) or six (prescriptive path) years.

**Figure 7: Stage at Which AMH Participation Was Ended (Aided) and Justifications**

### 3.3 Program Delivery and Processes

#### 3.3.1 Participant Satisfaction

Overall, participants were **highly satisfied with AMH**, with all 10 participants providing a score of 9 or 10 and the average overall satisfaction score being 9.7.<sup>7</sup>

When asked about their satisfaction with various aspects of AMH, participants continued to express general contentment. All participants were highly satisfied with the **upgrades installed**, the **quality of work completed**, and the **amount of the overall rebate**. All participants were also highly satisfied with the **program application process**, the **ability to get 50% of the rebate before the project ended** (comprehensive participants only), and **communications with E1**. No AMH participants expressed dissatisfaction (scores of 1-4) with any aspects of the program component.

<sup>7</sup> On a 0-to-10 scale where 0 means "Not at all satisfied" and 10 means "Completely satisfied".

**Figure 8: 2024 Satisfaction with AMH Program Elements**

One participant expressed a neutral level of satisfaction (scores of 5 to 7) with each of the selection of upgrades available, the time it took to complete the program component, and the time it took to receive the rebates. Overall, specific complaints about AMH aspects were minimal, isolated instances, and more likely unrelated to AMH itself but rather to associated external factors.

**Table 6: 2024 Elements of Dissatisfaction and Justifications**

| Element of Dissatisfaction<br>(Score of <8) |                                                |   | Reasons for Dissatisfaction (#)<br>(P = Prescriptive participant)                                         |
|---------------------------------------------|------------------------------------------------|---|-----------------------------------------------------------------------------------------------------------|
| n=1                                         | Selection of upgrades available                | › | Would like to see more options for prescriptive upgrades (1P)                                             |
| n=1                                         | Time it took to complete the program component | › | Took longer than estimated due to delays on the contractor side (1P)                                      |
| n=1                                         | Time it took to receive the rebate             | › | Rebate took longer to receive than the estimated timeframe due to paperwork getting lost in the mail (1P) |

## Satisfaction with AMH Forms and Reports

In general, participants who were able to answer were **highly satisfied with the AMH forms and reports**, including preapproval documentation, the rebate request form, and the upgrade recommendation report. The one comprehensive path participant who was less than satisfied with the rebate request form noted that, given their many properties involved in AMH, it would be easier for them if they could do a bulk submission instead of having to submit individual request forms for each property.

**Figure 9: 2024 Level of Satisfaction with AMH Forms and Reports**

A series of statements about AMH forms and reports was read and participants were asked to indicate the extent to which they agreed or disagreed with each. Once again, participants provided generally **positive results**. The preapproval documentation form, the instructions on how to fill out the rebate request form, and the upgrade recommendation report were **simple to understand**, and the rebate request form was **easy to complete**. While the AMH application was considered easy to complete and the instructions provided were simple to understand for most, a low number of participants provided a more neutral score (of 5 to 7). One person mentioned that, since so much information from different sources is needed to complete the report, it would be helpful if the online form could be partially completed and progress saved instead of having to be completed in one sitting. Although ratings were positive overall for both comprehensive and prescriptive participants, it is interesting to note that the limited number of ratings below a score of 8 were all provided by prescriptive participants.

**Figure 10: 2024 Level of Agreement with Statements About AMH Forms and Reports**

## Satisfaction with Aspects of the Energy Audit

The two interviewed participants who participated in the AMH comprehensive path and played a role in their energy audit were asked to comment on their satisfaction with the various aspects of the **energy audit** process. Both participants were highly satisfied with all aspects, including the **overall service provided by the energy auditor, the energy audit appointment scheduling process, the ability of the energy auditor to answer questions, and the information provided by the energy auditor.**

## Net Promoter Score

As illustrated in Figure 11 below, the Net Promoter Score (NPS) is a tool that measures customer experience with and overall perceptions about a brand or program. It is calculated by subtracting the “Promoters” (i.e. those who provide a score of 9 or ten 10 who will refer others and fuel growth) from the “Detractors” (i.e. those who provide a score of 0 to 6 and who can impede growth through negative word of mouth). The NPS can range from a maximum score of 100 (if everyone is a “Promoter”) to a minimum score of -100 (if everyone is a “Detractor”). The higher the NPS is, the better.

All ten AMH participants – including both prescriptive and comprehensive participant sub-groups – were considered “Promoters” of the program, meaning they would recommend it to other affordable housing providers. The NPS provided by each sub-group was 100, the highest possible score.

Figure 11: Likelihood to Recommend AMH, 2024

### 3.3.2 Energy Auditor Satisfaction

As with AMH participants, **EAs appear satisfied** overall with AMH as illustrated in Figure 12 below. They are particularly content with the **selection of upgrades** available through the program component. **Communications with E1**, including overall reporting, are perceived to be satisfactory in general. While the **10-day timeframe** to submit the energy audit report, photos, and analysis and the **simulator software** used to complete the audit and establish energy savings garner **more modest** satisfaction levels, the **audit reporting templates**, especially the **initial** audit template, appears to provoke **more discontent** among interviewed EAs.

The few justifications for lower satisfaction levels are presented in Table 7 further below. Of note, EA dissatisfaction with the reporting templates relate to them **not being user-friendly**, being **Word-based rather than Excel-based**, and providing **little flexibility** in data entry. It should be noted that E1 rolled out an Excel template in the past; however, results were unsatisfactory for the E1 staff and they decided to revert back to using the Word template.

Additionally, a couple of EAs mentioned that they sometimes lacked information on current building systems. Having this information before their initial visit would be helpful to EAs.

**Figure 12: 2024 Energy Auditor Satisfaction with Various Elements of AMH**

**Table 7: 2024 Elements of Dissatisfaction and Justifications Among EAs**

| Element of Dissatisfaction (Score of <8) |                                                                        | Reasons for Dissatisfaction (#)                                                                                                                                                                                                                                                                                                                           |
|------------------------------------------|------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| n=4                                      | Initial audit reporting template                                       | <ul style="list-style-type: none"> <li>› Template is not user-friendly/awkward/lengthy to fill out (n=3)</li> <li>› Would prefer an Excel-based template (n=2)</li> <li>› Template does not provide flexibility for data entry (n=1)</li> </ul>                                                                                                           |
| n=2                                      | Final audit reporting template                                         | <ul style="list-style-type: none"> <li>› Would prefer an Excel-based template (n=2)</li> <li>› Onerous process/finicky (n=2)</li> <li>› Template does not provide flexibility for data entry (n=1)</li> </ul>                                                                                                                                             |
| n=2                                      | Simulator software to complete audit & establish energy savings        | <ul style="list-style-type: none"> <li>› R2000 only provides a two-dimensional approach and gives energy rating as stock rather than real-world performance (n=1)</li> <li>› Issues with using RETScreen (n=1)</li> </ul>                                                                                                                                 |
| n=2                                      | Info about participant & project E1 provides at start of a new project | <ul style="list-style-type: none"> <li>› Insufficient information regarding existing systems provided before the initial visit (n=2)</li> <li>› No consistent format in application – handwritten, printable PDF (n=1)</li> <li>› Lengthy process to obtain historical energy invoices (n=1)</li> </ul>                                                   |
| n=2                                      | Timeframe for submitting energy audit, photos, etc. to E1 (10 days)    | <ul style="list-style-type: none"> <li>› The two-week timeline is no longer relevant now that EnerGuide is not used for audits (n=1)</li> <li>› Limited staffing makes it difficult to handle AMH and non-program workload (especially when AMH workload varies throughout the year, making it difficult to staff at the required level) (n=1)</li> </ul> |
| n=2                                      | Initial energy audit scheduling process with participant               | <ul style="list-style-type: none"> <li>› Tight timelines to contact participants/schedule visits (2 days) (n=1)</li> <li>› Random email notifications from AMH (n=1)</li> </ul>                                                                                                                                                                           |
| n=1                                      | Final energy audit scheduling process with participant                 | <ul style="list-style-type: none"> <li>› Random email notifications from AMH (n=1)</li> </ul>                                                                                                                                                                                                                                                             |
| n=1                                      | Communications you have with E1                                        | <ul style="list-style-type: none"> <li>› Too few communications/check-ins with E1 (n=1)</li> </ul>                                                                                                                                                                                                                                                        |
| n=1                                      | Overall reporting to E1                                                | <ul style="list-style-type: none"> <li>› No evaluation of performance across participants/case-by-case only/no performance metrics (n=1)</li> <li>› SharePoint is not user-friendly (n=1)</li> </ul>                                                                                                                                                      |

### 3.3.3 Other Aspects of Program Delivery

#### Service, Relationship Building, and Flexibility

E1 staff are of the opinion that the AMH **prescriptive** path offers **quick and easy turnaround** and a **hands-on service** to participants. They see the **comprehensive path** as complementing the prescriptive path by providing the option of **full building upgrades**, custom **solutions**, and the chance for E1 to **form relationships** with participants as they navigate projects that can sometimes take a long time and present challenges. EAs add that the comprehensive list of opportunities for upgrading a building, including multiple fuel types and system improvements beyond energy upgrades (e.g. electric system upgrades), can be implemented over time if desired.

## Rebate, Calculations, and Financial Concerns

For EAs, the **AMH rebate** is considered one of AMH's greatest strengths, as confirmed by participant satisfaction levels (see Figure 8 above), along with the **energy cost savings** resulting from any upgrade. E1 staff mention that the ability to **receive 50% of the rebate before project completion** is also well received (as confirmed by the one participant who provided a satisfaction score of 10/10 on this aspect). That said, E1 reports that participants do not always realise that they **must pay the tax on the overall project expenditure** and that the program component only covers **up to 80% of pre-tax costs** based on the costs-to-energy-savings ratio. E1 explains over the phone and in emails to participants how the incentives work and is working on wording to make things clearer, but participants still have difficulties understanding how much rebate they will be given and how the rebate is calculated. Recent **increases in supply chain costs** (labour, equipment) also mean that participants often only receive up to 60-70% of their pre-tax outlay because of high contractor fees affecting the costs-to-energy-savings ratio.<sup>8</sup> To get the best deal and incentive, participants therefore need to shop around for quotes.

Additionally, EAs mention that some participants think that the **estimated incentive** for the upgrades presented in the preapproval report is the **amount they will receive** at the end of their project, although the amount can change based on the actual equipment installed. A situation such as this can cause frustration and disappointment after a project has been completed. E1 staff report that they considered removing the estimated incentive from the preapproval report but feel that participants would still reach out to them anyway to have an idea of how much incentive they might be getting.

Participant confusion with the necessary steps of the program component can also be problematic. Since AMH requires project preapproval, participants need to wait until E1 reviews and approves the quotes, although some participants start the work before preapproval is provided, possibly affecting the incentive amount they receive if they are not approved for all the work.

According to EAs, other participants' financial concerns associated with AMH include difficulty securing upfront capital to pay for the upgrades, the lack of recognized audits that could help participants secure other financial assistance, and AMH rent control requirements (see Subsection 3.3.5 below for more details on perceptions regarding the affordability covenant).

## Managing Projects and Finding Contractors

Over and above the E1 service provided throughout AMH participation, some EAs receive requests from participants for **additional project management assistance**. EAs mention that participants are sometimes ill-equipped to manage implementing the recommended upgrades themselves as they lack project management skills and/or have difficulty securing contractors.

EAs cite **challenges in finding contractors** to provide quotes and perform the work, which can cause significant delays (and also affect incentive levels – see subsection on “Rebate, Calculations, and Financial Concerns” above). This appears to be especially problematic in the Cape Breton area.

E1 staff mention that project management assistance for participants would be advantageous.

---

<sup>8</sup> It should be noted that supply chain cost increases have led E1 to modify its incentive calculations accordingly.

## Upgrades

### EA Staff Planning

Finally, one EA mentioned that having a limited number of AMH projects makes it difficult for them to ensure an adequate staff complement at all times and that their staff may forget aspects of AMH if only a few audits are completed in a given year.

### 3.3.4 Affordability Covenant

#### AMH Participant Perceptions

Questions about perceptions of the **affordability covenant** were posed to the six AMH participants with MURBs.<sup>9</sup> All six indicated they charge rent to their tenants and therefore were obligated to agree to the affordability covenant. When asked about their opinions on the affordability covenant, six participants had a **positive or neutral** perception for both the term length and the imposed rental rates. Several participants elaborated that the term length and rates were **fair and acceptable** to them given that they were **already an affordable housing provider** (for example, co-op, housing group for Indigenous people, non-profit or government-owned housing, participating in an affordability program) so the covenant did not change their operations. Only one concern was shared suggesting that, for government-owned buildings, the government could choose to divest from the property before the covenant term is up, but it was stated by this participant that such instances are rare.

Given the positive perceptions about the covenant, few suggestions were offered in terms of modifications that could be made. Only one participant proposed that the rent be adjusted in the Halifax Regional Municipality specifically, saying that the cap was too low compared to what was charged for other properties located in the area.

#### Dropped-out Participant and Non-participant Perceptions

Across the 14 **dropped-out participants and non-participants** who charge rent to tenants, opinions on the AMH operating agreement/affordability covenant tended to be **highly polarized**; six offered positive assessments and five offered negative assessments of the affordability covenant overall. The others either had mixed opinions on the topic (n=1) or were reluctant to offer any type of opinion without reviewing, in detail, the affordability covenant again (n=2).

All those with **positive perceptions** of the affordability covenant recalled the **rental rate being higher than** what they currently charge in rent to their tenants. Conversely, **opposition** was primarily driven by perceptions of the **rental rates being too low**, so much so that the rates were cited as a core reason for not pursuing AMH. For these individuals, **modifications** to the proposed rental rates (i.e. making them more in line with current market rates) were seen as **critical in changing their perceptions** about AMH. As with the one AMH participant mentioned above, one non-participant also took issue with how the rates were differentiated by region, with the rate for Halifax falling in the same category as other communities deemed as non-comparable. As such, they felt Halifax should have its own rental rate that is higher than other communities. It should be noted that E1 reported originally having separate regions for the Halifax area and included two communities under the same umbrella since the market rate was equivalent. E1 is also in the process of developing a new methodology to determine affordability criteria and calculate rental rates.

---

<sup>9</sup> The remaining four participants were non-bed facilities (n=3) and a shelter (n=1).

**No dropped-out participants and non-participants**, even those opposed to the affordability covenant, **expressed significant concern over the AMH term lengths**, and reducing the agreement terms from 12 years to 10 years (for comprehensive) and from six years to five years (for prescriptive) had minimal impact on their opinions of the covenant.

### 3.3.5 Participant Questions and Concerns

Participants' questions to EAs during the initial energy audit visit vary based on their level of understanding of AMH, their knowledge of their building's construction, and/or their interest in the potential upgrades. The questions EAs receive generally relate to the **AMH rebate** to be expected, the **next steps**, and building operation questions that are outside of the AMH scope.

With respect to energy efficiency in particular, **heating systems** (e.g. heat pumps) and **insulation generate the most questions** from participants according to EAs. Less commonly, participants enquire about mechanical systems, ventilation, hot water, and windows.

Specific questions included the following:

- › Is a backup heating source required when installing heat pumps?
- › What are the costs to upgrade insulation and windows?
- › What is the current level of insulation and what specific products are eligible?
- › What are the potential energy cost savings from heat pump technology?
- › Will the electrical system accommodate the recommended upgrades?
- › Will the heat pump technology provide adequate heat for tenants?
- › Will the old heating system be removed/can it be removed?
- › Where will the ductwork be located?
- › Which contractors should I use/can I trust?

## 3.4 Participant and EA Suggestions for Improvements

AMH participants were presented with a list of seven tools and supports that could be offered to help them navigate the program component. Two of the top three tools/supports mentioned as first or second most helpful (see Figure 13 below) concern monetary aspects, namely **co-funding**<sup>10</sup> and **low-interest financing**. **Technical/maintenance support** and **help finding contractors** follow. **Information on the upgrades installed** and **case studies** were also considered useful by some.

---

<sup>10</sup> E1 or another provider shares part of the project cost.

**Figure 13: Helpfulness of Various Tools/Support for AMH (Aided), 2024**

Participants were asked if they had any suggestions for improving AMH. Given the overwhelming perceived positivity about the program component, it is unsurprising that seven of the 10 participants had no recommendations. The two remaining participants each provided a unique suggestion for improvement as follows:

- › One participant suggested that some kind of **tutorial be offered to help participants learn how to maximize the efficiency of their heat pumps.**
- › One participant would like to see AMH cover **window upgrades** in addition to other measures.

Many suggestions were shared by EAs to improve the AMH process, notably around the **administrative functions**. Recommendations included the following:

- › Developing a **portal for delivery agents** to provide access to leads and progress information on current projects
- › Giving EAs more information about **current building systems and participants' goals** before the initial visit
- › Using **Excel** for all reporting templates
- › Simplifying the reporting templates
- › Allowing flexibility in data entry
- › Implementing regular **post-mortem meetings** with EAs to discuss AMH and issues or sharing best practices identified by EAs
- › Using the EnerGuide audit process if using HOT2000
- › Streamlining the application process when a complete audit is not needed
- › Allowing for virtual audits to be completed

EAs also provided specific suggestions for **materials and training** to facilitate their role in AMH. While EAs appreciate the current training, they would like training to include:

- › More free sessions for simulating different scenarios
- › Training specific to CanQuest and RETScreen with sufficient advance notice
- › Training specific to MURB evaluations
- › Greater consistency between the simulation and auditing processes
- › Access to a building imagery tool

Beyond continuing to reach out directly to various organizations, charities, and non-profits to increase participation in AMH, one EA mentioned that E1 should **educate municipalities** about the program component so they can market it to organizations within their jurisdiction.

Finally, one EA would like to see solar panels added as an eligible measure.

## 3.5 Alternatives for Implementing Other Energy Efficiency Measures

### Alternative Programs

Two dropped-out participants and five non-participants stated that they either had taken part in a program other than AMH or had plans to do so in the near future. One dropped-out participant noted that they had not explored other programs due to the perceived administrative burden required to do so.

Dropped-out Participants:

- › One noted participating in another E1 program specifically targeted at affordable new builds since they were ineligible for AMH.
- › One reported participating in AMH for another property in collaboration with Housing Nova Scotia.

Non-participants:

- › Two noted participating in other E1 programs in the past but were unable to recall the program name.
- › Three non-participants were considering taking part in other programs in the near future. Interviewees were under the impression that participation in another program would not necessarily limit their participation in AMH should they wish to reapply.
  - › One is planning to put in an application to the Government of Nova Scotia's Community Housing Infrastructure and Repair Program.
  - › One is looking into programming with the Affordable Housing Association of Nova Scotia (no specific details were provided).
  - › One is interested in Canada Mortgage and Housing Corporation's (CMHC) Mortgage Loan Insurance (MLI) Select program (focused on financing rather than providing grants).

Outside of energy efficiency programs, only two dropped-out/non-participant interviewees noted seeking additional funding to help implement energy efficiency measures in their building.

- › One non-participant reported getting support through Housing Nova Scotia.
- › One dropped-out participant reported having sought funding from multiple sources including:
  - › CMHC's Co-Invents Fund/Affordable Housing Fund
  - › Seed funding for planning and development through the Department of Municipal Affairs and Housing
  - › The Affordable Housing Program
  - › The Community Housing Growth Fund

## Energy Efficiency Upgrades

Only three interviewees noted having completed energy efficiency upgrades in the past year: One dropped-out participant had made several energy efficiency upgrades, including new insulation, installing heat pumps, replacing windows and doors, and putting in new energy efficient appliances (Housing Nova Scotia). Two non-participants also reported completing recent upgrades, with one having recently replaced their insulation (through another E1 residential program) and the other having made several energy efficiency upgrades, including new window siding, heat pumps, and lighting (they had the opportunity to complete the work quickly at a discount contractor price and did not go through any program).

### 3.6 Annual Energy Efficiency Budget and Payback Period

#### Budget

Half (5/10) of interviewed **AMH participants** specified a numeric answer in terms of their **budget for building maintenance and efficiency upgrades**. The remaining five participants indicated they either did not know or did not have a budget but rather made ad hoc repairs and installs **as needed**, and this was especially the case among non-profit organizations or those with smaller buildings. Budgets fell within a very wide range of \$500-\$300,000 annually with \$300,000 being an outlier among this cohort. With the outlier removed, the average budget for maintenance or upgrades was **\$3,625** per year.

Similarly, only two non-participants (one rooming house and one rental/co-op) reported having a budget for building maintenance and efficiency upgrades. The annual building maintenance and efficiency upgrade budget for the rooming house was estimated at approximately \$14,000, while the rental/co-op budget was estimated at \$2,500. All other dropped-out participants and non-participants noted having no formal budget in place, with **expenses dealt with on an ad hoc basis**.

#### Payback Period

Three of the ten AMH participants considered a **payback period** for participation in their AMH project. Of these, two said their required period was **less than five years**, and the other said they would have gone ahead with a period of five to ten years, but when they did the calculation, they determined they would recoup their investment in approximately three to four years. Several of the those who did not consider a payback period indicated that they were either receiving funding elsewhere and **going to move ahead with the project regardless**, or they required 100% of their costs to be covered or would not have been able to proceed with the project. In either case, a payback period was not relevant to these participants.

Dropped-out participants and non-participants generally considered any payback period **over a decade to be unreasonable**. The majority (n=8) would consider a five to 10-year payback period to be acceptable and some (n=4) noted they generally required the period to be less than five years. Two interviewees were uncertain as to what length of time would be acceptable, while an additional two interviewees noted that it would depend on the type of upgrade, with larger upgrades and the corresponding higher price tag and longer product lifetime expected to have a longer payback period.

## Rent

Of the six MURB AMH participants with tenants, four indicated that their tenants **pay their own utility costs**. The other two participants said that utilities were included in their tenants' rent. Among dropped-out participants and non-participants, three reported that their tenants paid full utility costs, and four noted that their tenants paid a portion of the utilities (e.g. paying directly for electricity and heating included in rent). Outside of shelters and non-bed housing, all other interviewees noted that utilities were included in their rent.

### 3.7 Overview of AMH Strengths and Challenges

The following provides a summary of the strengths and challenges associated with AMH.

#### AMH Strengths:

- › Financial support for affordable housing
- › Provides a comprehensive list of upgrades that can be implemented over time
- › 50% incentive received before project end
- › Potential energy cost savings
- › High overall satisfaction with AMH among participants
- › High overall satisfaction with AMH among EAs
- › Participants satisfied with EA service and energy audit
- › AMH forms and reports clear and easy to complete for participants
- › Highest possible Net Promoter Score (likelihood to recommend AMH) of 100
- › No significant concern over the operating agreement term lengths

#### AMH Challenges:

- › Participation limited by availability of capital funds and lack of budget
- › Rent control requirements make AMH unattractive to some
- › Some participant confusion over proportion of costs covered by rebate
- › Increasing supply chain costs
- › Difficulty securing contractors to implement recommended upgrades
- › Older buildings may require costly preparation work before upgrades can be implemented (e.g. electrical upgrades)
- › Some participants need more handholding due to limited project management skills to coordinate the implementation of upgrades
- › Word format reporting templates not user-friendly
- › EAs sometimes lack initial information on current building systems

## 4 AMH Impact Evaluation

The objectives of the 2024 AMH impact evaluation were to determine gross and net electrical energy and peak demand savings, annually avoided GHG emissions, as well as the EUL and associated lifetime energy savings.

### 4.1 Tracking Sheet Audit

To ensure program results were reliably compiled, the Evaluator first performed a tracking sheet audit aimed at verifying the completeness and consistency of the data submitted by E1 as well as correcting the tracked savings as needed. The results are provided in Appendix I. The tracked savings results presented in this report therefore refer to the corrected tracked savings obtained by the Evaluator.

### 4.2 Gross Savings

Gross savings correspond to the change in energy consumption resulting from various electrical energy saving upgrades such as building envelope measures, space heating measures, and domestic hot water (DHW) measures implemented by AMH participants.

The following subsections describe the methodology used to review AMH gross savings for 2024. Interactive effects and EUL values were also assessed.

#### 4.2.1 Energy Savings

For the 2024 AMH evaluation, the Evaluator conducted desk reviews of five comprehensive projects and 10 prescriptive projects. The reviews served to establish the evaluated savings and adjustment ratios if possible.

#### Comprehensive Path Project Desk Review Findings

Through the 2024 comprehensive path project desk reviews, the Evaluator made three types of adjustments:

- › The impacts of some measures on other systems, which correspond to interactive effects, was not properly modelled in RETScreen for three projects. Correcting these errors reduced the electrical energy savings of two projects by 23% and 5% respectively, while the correction for the other project had an impact only on non-electrical energy savings.
  - › Since this change impacted three of the five reviewed projects, the Evaluator recommends that E1 improve the modeller checklist to include a validation of the proper consideration of interactive effects in RETScreen to reduce the likelihood that this situation occurs again in the future.
- › For one project, one measure was not implemented, yet the model included it. Removing this measure reduced the savings by 25%.
- › In two cases, minor discrepancies were found between the parameters used in the models and those included in reporting. The resulting adjustments had an impact of 1% or less on the project savings.

The comprehensive path project reviews resulted in an overall adjustment ratio of 0.873 with a margin of error of 18% for the reviewed projects. This margin of error was too high to extrapolate a ratio to adjust the energy savings of non-reviewed comprehensive path projects. Thus, the Evaluator elected to use the 2024 tracked savings as the evaluated savings for non-reviewed comprehensive path projects.

## Prescriptive Path Project Desk Review Findings

Energy savings for AMH prescriptive path projects are calculated using the 2024-2025 DSM MA equations. Among the reviewed prescriptive path projects, four were lighting projects and six were heat pump projects. For lighting projects, the evaluated energy savings were the same as tracked savings, so no adjustment ratio was necessary.

For AMH heat pump projects, the full-load hours of most projects are based on the residential value from Green Heat. Since the full-load hours are derived from 2017 Green Heat billing analysis results and the heating season performance factor (HSPF) of the heat pumps in that analysis, the full-load hours were adjusted to consider the change from HSPF to HSPF2. This change resulted in an increase of 6% in energy savings for three of the six projects. The full-load hours of the other three projects were not based on the residential value since occupants mostly only sleep in the relevant buildings and do not use them as a residence.

Also, for one project, the HSPF2 value used by E1 was for Region IV while Nova Scotia is in climate zone Region V. This change reduced the energy savings of that project by 10%.

All changes to prescriptive heat pump projects resulted in an overall adjustment ratio of 1.016 with a margin of error of 2.8%, which is below the 10% threshold. Since the update to the residential full-load hours will be implemented by E1 when implementing the 2024-2025 DSM MA, the Evaluator considers that most changes resulting from the 2024 prescriptive heat pump project reviews will not carry over to future evaluations. Therefore, the Evaluator elected to use the adjustment ratio for all prescriptive heat pump projects only in the 2024 evaluation.

### Adjustment Ratio Summary

The above changes resulted in three different adjustment ratios for energy savings. Table 8 summarizes the energy savings adjustment ratios and margins of error obtained for the different AMH project categories. One-time adjustments are also included for AMH project categories with adjustment ratios that were not extrapolatable to non-reviewed projects.

**Table 8: 2024 AMH Energy Savings Adjustment Ratios**

| Project Category       | Adjustment Ratio | Margin of Error | Summary                                                                                             | One-time Adjustment (GWh) |
|------------------------|------------------|-----------------|-----------------------------------------------------------------------------------------------------|---------------------------|
| Comprehensive          | 0.873            | 17.7%           | Not extrapolated to non-reviewed projects                                                           | -0.010                    |
| Prescriptive Lighting  | 1.000            | 0%              | -                                                                                                   | -                         |
| Prescriptive Heat Pump | 1.016            | 2.8%            | Applied to all 2024 projects, including non-reviewed projects; not applicable to future evaluations | -                         |

### 4.2.2 Peak Demand Savings

Peak demand savings correspond to the demand savings that coincide in time with the peak demand period of the electricity system. The projected electricity peak demand period in Nova Scotia is defined as the coldest days (with an on-peak temperature estimated at -15 °C) between 5 p.m. and 7 p.m. in the months of December to February on non-holiday weekdays.

Similarly to energy savings, project reviews served to adjust peak demand savings.

## Comprehensive Project Review Findings

For AMH comprehensive projects, peak demand savings are obtained by multiplying the energy savings by a peak demand-to-energy ratio of 0.283 W/kWh as indicated in the 2024-2025 DSM MA. This resulted in the same adjustment ratio and margin of error as for comprehensive project energy savings, which was not extrapolatable due to the margin of error being too high. Therefore, no adjustment ratio was applied to non-reviewed projects.

## Prescriptive Project Review Findings

Similarly to energy savings, peak demand savings for AMH prescriptive projects are calculated using the 2024-2025 DSM MA equations.

For lighting projects, project reviews revealed that E1 used a peak coincidence factor of 1 for all lamps, which implies that all replaced lamps were assumed to be ON during peak hours. The Evaluator adjusted the peak coincidence factor for all lamps based on hours of use,<sup>11</sup> which resulted in 32% less peak demand savings on average for lighting projects. However, the margin of error was too high to extrapolate the resulting adjustment ratio to non-reviewed projects.

For heat pump projects, the Evaluator made no adjustment to peak demand savings, thereby resulting in evaluated savings being equal to tracked savings.

Therefore, no adjustment ratio was extrapolated for non-reviewed prescriptive project peak demand savings.

## Adjustment Ratio Summary

The above changes resulted in three different adjustment ratios for peak demand savings. Table 9 below summarizes the peak demand savings adjustment ratios and margins of error obtained for the different AMH project categories. The table also includes one-time adjustments that were applied to AMH project categories for which adjustment ratios were not extrapolatable to non-reviewed projects.

**Table 9: 2024 AMH Peak Demand Savings Adjustment Ratios**

| Project Type           | Adjustment Ratio | Margin of Error | Summary                                   | One-time Adjustment (MW) |
|------------------------|------------------|-----------------|-------------------------------------------|--------------------------|
| Comprehensive          | 0.873            | 17.7%           | Not extrapolated to non-reviewed projects | -0.003                   |
| Prescriptive Lighting  | 0.676            | 23.1%           | Not extrapolated to non-reviewed projects | -0.006                   |
| Prescriptive Heat Pump | 1.000            | 0%              | -                                         | -                        |

### 4.2.3 Interactive Effects

In a home, interactive effects occur when the implementation of energy efficiency measures has an impact on the energy consumption of other factors such as heating and cooling. The interactive effects of space heating and DHW measures were already considered in the savings calculations of comprehensive projects since the engineering calculations or the simulation models encompass those effects. For prescriptive projects, the 2024-2025 DSM MA includes interactive effects when applicable.

<sup>11</sup> Since schedules are not documented in project documentation, the Evaluator assumed that lamps that were ON for 10 hours or more per day each were likely ON during peak hours; therefore, the Evaluator maintained a peak coincidence factor of 1. Otherwise, the Evaluator assumed that operating hours were spread equally throughout the year and established the peak coincidence factor by dividing the annual operating hours by the total number of hours in a year.

## 4.2.4 Effective Useful Life

Using the EUL values presented in the 2024-2025 DSM MA and the proportion of savings for measures implemented through AMH in 2024, the Evaluator revised the EUL values for comprehensive projects. For prescriptive projects, EUL values for each measure were drawn from the 2024-2025 MA and remained the same as in the 2023 evaluation. For comprehensive projects, the weighted average EUL increased from 17.7 years in 2023 to 20.5 years in 2024. Table 10 below outlines the shares of savings and the equivalent EUL values for each measure category used to calculate the weighted average EUL for comprehensive projects.

**Table 10: 2024 AMH Equivalent EUL Values for Comprehensive Projects**

| Measure Category            | Share of Savings [%] | Evaluated Equivalent EUL [years] | Reference                                                                                                            |
|-----------------------------|----------------------|----------------------------------|----------------------------------------------------------------------------------------------------------------------|
| Heating Systems             | 63.9%                | 18                               | GDS, 2007 – Heat Pumps                                                                                               |
| Building Envelopes          | 22.2%                | 30                               | California Public Utilities Commission, 2023                                                                         |
| Fenestration                | 10.6%                | 20                               | DEER, 2014 – Windows                                                                                                 |
| Ventilation                 | 1.8%                 | 10                               | GDS, 2007 – Programmable Thermostats                                                                                 |
| Lighting                    | 1.5%                 | 5.7                              | Lifetime of 50,000 hours based on model specifications; assumption that lamps are in common zones and turned on 24/7 |
| <b>Weighted Average EUL</b> | <b>100%</b>          | <b>20.5</b>                      | <b>Calculation</b>                                                                                                   |

## 4.2.5 Evaluated Gross Savings

The annual gross savings at the generator are presented in Table 11 below.

The gross energy savings at the generator were estimated by using different line loss factors for each participant based on their rate code. The line loss factors correspond to the values submitted to the NSUARB as part of Nova Scotia Power 2014 Cost of Service Study Progress Update.<sup>12</sup> With total gross electrical energy and lifetime electrical energy savings of 1.159 GWh and 19.397 GWh respectively, the average EUL value for AMH was 16.7 years in 2024.

<sup>12</sup> Nova Scotia Utility and Review Board, Matter M06555, 2014 Cost of Service Study Progress Update, Exhibit N-2.09, Appendix 1.

**Table 11: Evaluated 2024 AMH Gross Energy and Peak Demand Savings**

|                                                               | Comprehensive | Prescriptive  |              | Total         |
|---------------------------------------------------------------|---------------|---------------|--------------|---------------|
|                                                               |               | Heat Pumps    | Lighting     |               |

| <b>Gross Lifetime Energy Savings – at the Generator (GWh)</b> | <b>4.849</b>  | <b>13.598</b> | <b>0.951</b> | <b>19.397</b> |
| <b>Peak Demand Savings</b>                                    |               |               |              |               |
| Tracked Gross Peak Demand Savings – at the Meter (MW)         | 0.064         | 0.418         | 0.029        | 0.511         |
| Adjustment Ratio for Peak Demand Savings                      | 1.000         | 1.000         | 1.000        | -             |
| One-time Adjustment for Peak Demand Savings (MW)              | -0.003        | -             | -0.006       | -0.009        |
| <b>Gross Peak Demand Savings – at the Meter (MW)</b>          | <b>0.061</b>  | <b>0.418</b>  | <b>0.023</b> | <b>0.502</b>  |
| Line Loss Factor                                              | 1.1346        | 1.1346        | 1.1346       | -             |
| <b>Gross Peak Demand Savings – at the Generator (MW)</b>      | <b>0.069</b>  | <b>0.475</b>  | <b>0.026</b> | <b>0.570</b>  |

As presented in Table 12, GHG emissions reductions were calculated by applying the Nova Scotia-specific factor<sup>13</sup> for GHG emissions generated by electricity production to AMH gross savings results.

**Table 12: Evaluated 2024 AMH Gross GHG Emission Reductions**

|                                                                                             | Total        |
|---------------------------------------------------------------------------------------------|--------------|
| <b>Gross Energy Savings – at the Generator (GWh)</b>                                        | <b>1.159</b> |
| Nova Scotia-specific GHG Emissions Factor for Electricity Production (tonnes of CO2 eq/GWh) | 472.2        |
| <b>Gross Annual GHG Emission Reductions (tonnes of CO2 eq)</b>                              | <b>547</b>   |

<sup>13</sup> At the time of writing, 2024 data were not yet available. The Nova Scotia-specific factor was obtained from Nova Scotia Power's 2023 total system emissions data (4,931,152 CO2 eq tonnes), and total electricity generation (10,442 GWh) was drawn from the following two sources: Nova Scotia Power, Total System Emissions, <https://www.nspower.ca/clean-energy/air-emissions-reporting> (last accessed September 27, 2024) and Emera Inc., Emera Inc. 2023 Annual Report, p. 31, available at [https://s25.q4cdn.com/978989322/files/doc\\_financials/2023/ar/Emera\\_2023\\_AR\\_FINAL.pdf](https://s25.q4cdn.com/978989322/files/doc_financials/2023/ar/Emera_2023_AR_FINAL.pdf) (last accessed September 27, 2024).

## 4.3 Net Savings

The Evaluator determined the net energy and peak demand savings, i.e. the electrical energy and peak demand savings that can be reliably attributed to a program component, by estimating the net-to-gross ratio (NTGR). More precisely, the NTGR represents the positive or negative impacts of spillover and free-ridership effects on gross savings. For AMH, free-ridership and spillover effects were considered to be nil since participants are non-profits or low-income housing owners with limited budgets for building improvements. Therefore, a NTGR of 1.00 was applied.

### 4.3.1 Evaluated Net Savings

Net savings are defined as the changes in energy use that are specifically attributable to AMH. Since spillover and free-ridership effects were considered nil, the net energy savings are equal to the gross savings generated by the program component. Likewise, the net annual GHG emission reductions are equal to the gross annual GHG emission reductions.

As outlined in Figure 14, AMH fell short of its electrical energy and peak demand savings targets by 39% and 64% respectively.

**Figure 14: 2024 AMH Targets and Evaluated Results**

## 4.4 Realization Rate

Table 13 below compares the energy and peak demand savings established through this evaluation to those calculated in the 2024 tracking sheet. It also includes the realization rate, representing the ratio of evaluated net savings to tracked net savings, for both energy savings and at peak demand savings.

**Table 13: Comparison of 2024 AMH Tracked and Evaluated Savings at the Generator**

|                                                                                                                           | Gross Savings |      | NTGR* | Net Savings |      | Realization Rate |
|---------------------------------------------------------------------------------------------------------------------------|---------------|------|-------|-------------|------|------------------|
|                                                                                                                           | Value         | Unit | Value | Value       | Unit | Value            |
| Energy Savings                                                                                                            |               |      |       |             |      |                  |
| Tracked Savings by E1                                                                                                     | 1.158         | GWh  | 1.00  | 1.158       | GWh  | 100%             |
| Evaluation Results                                                                                                        | 1.159         | GWh  | 1.00  | 1.159       | GWh  |                  |
| Peak Demand Savings                                                                                                       |               |      |       |             |      |                  |
| Tracked Savings by E1                                                                                                     | 0.580         | MW   | 1.00  | 0.580       | MW   | 98%              |
| Evaluation Results                                                                                                        | 0.570         | MW   | 1.00  | 0.570       | MW   |                  |
| * The NTGRs presented in this table correspond to the rounded averages obtained by dividing net savings by gross savings. |               |      |       |             |      |                  |

The net evaluated electrical energy savings and evaluated peak demand savings were nearly the same as the values tracked by E1. The differences are due to the application of the adjustment ratio and one-time adjustments.

## 5 AMH Key Findings and Recommendations

As mentioned previously, the main objectives of the 2024 AMH evaluation were as follows:

- › Collect information on participant and distributor perspectives
- › Calculate AMH gross and net results, namely electrical first-year and lifetime energy savings, peak demand savings, as well as avoided GHG emissions

This section provides the Evaluator's key findings and recommendations in relation to the above objectives.

### **2024 AMH-Finding: The Evaluator surveyed high levels of satisfaction overall.**

All 10 interviewed participants said that they were highly satisfied with AMH and “would definitely” recommend the program component to other housing providers or affordable multifamily residential building owners (Net Promoter Score of 100). Everyone agreed that AMH is simple to understand and easy to complete. EAs were also satisfied with AMH overall, particularly with the selection of upgrades.

### **2024 AMH-Finding: Incentive calculations can cause confusion among participants.**

Participants do not always realize that they must pay tax on overall project expenditures and that the program component only covers up to 80% of pre-tax costs. E1 provides verbal and written explanations to participants on how incentives are determined and is working on wording to make things clearer, but participants still have difficulty understanding how much rebate they will be granted and how the rebate is calculated. Furthermore, some participants believe that the estimated incentive for the upgrades presented in the preapproval report is the amount they will receive at the end of their project, although this amount can change based on whether all the proposed equipment is installed.

**Recommendation #1:** To further aid understanding, consider providing participants with **case study** examples of incentive calculations to show pre-tax costs and how incentive amounts may change based on supplier quotes and/or equipment installed.

### **2024 AMH-Finding: Some participants would benefit from project management support.**

Based on comments from E1, EAs and participants, project management assistance, technical/maintenance support, and help finding contractors would be useful for participants. Without this assistance, project delays are said to occur. Not being able to find a contractor was also cited as a reason for withdrawing from the program component.

Some participants consider that having more information on the upgrades installed (many energy efficiency questions from participants concern heat pumps and insulation) and case studies would also be valuable.

**Recommendation #2:** Ensure that support and handholding are available for participants who may need help navigating the program component and finding various contractors. Make technical guides available, providing general advice to help participants through the program component.

### **2024 AMH-Finding: Among EAs, satisfaction is low with the audit reporting templates.**

The audit reporting templates generate lower satisfaction levels among EAs, particularly the one for the initial audit. EAs consider that the templates are lengthy and awkward to fill out and would prefer them to be Excel-based rather than Word-based for more data entry flexibility.

**Recommendation #3:** Investigate the possibility of improving the audit reporting templates to improve time efficiencies for EAs, for example by streamlining the reports as much as possible.

### **2024 AMH-Finding: Costs and lack of budget are barriers to participation.**

Financial barriers constitute the main reasons most interviewed dropped-out participants withdrew from the program component. The majority had no budget available for building maintenance and efficiency upgrades, a situation that was echoed among most interviewed non-participants and half of AMH participants. Necessary repairs and upgrades are dealt with on an ad-hoc basis. Half of interviewed dropped-out participants also had issues with the operating agreement, specifically that the rental rates were too low (see the next finding below). In view of the constraints faced by many affordable multifamily housing providers, it is not surprising that participants choose co-funding and low-interest financing as tools and support that would be most helpful to them.

Less frequent mentions for withdrawing from AMH included building ineligibility and the desired upgrades not being included (roof repairs, electrical panel upgrades).

**Recommendation #4:** In the early stages of participant engagement, ensure that participants are aware of the co-financing options that are listed in E1's agreement.

### **2024 AMH-Finding: Rental rates in the operating agreement cause division among dropped-out participants and non-participants.**

Opinions on the operating agreement among dropped-out participants and non-participants were polarized. Negative perceptions were due to the rental rates in the agreement being lower than what dropped-out participants and non-participants currently charge and were therefore a barrier to participation (see the next finding above). Modifications to the proposed rental rates (i.e. making them more in line with current market rates) were seen as critical in changing these negative perceptions about AMH among dropped-out participants and non-participants. E1 regularly reviews rental rates to align with current market conditions.

### **2024 AMH-Finding: Term lengths are not a significant problem.**

No participants, dropped-out participants, or non-participants expressed significant concern about AMH term lengths. Reducing the agreement terms from 12 years to 10 years (for comprehensive projects) and from six years to five years (for prescriptive projects) had minimal impact on their opinions of the covenant. The Evaluator is therefore of the opinion that E1 does not need to revise the term lengths because they are not a current barrier to participation.

### **2024 AMH-Finding: AMH net electrical energy savings and peak demand savings fell short of targets.**

In 2024, AMH achieved 1.159 GWh in net electrical energy savings and 0.570 in net peak demand savings at the generator, falling short of planned net electrical energy savings of 1.900 GWh by 39% and planned net peak demand savings of 1.581 MW by 64%.

**2024 AMH-Finding: In 2024, despite a slight increase in participation compared to 2023, AMH achieved lower savings than in 2023.**

AMH reached its highest participation rate since inception with 83 completed projects generating electrical savings in 2024, which represented a 5% increase compared to 2023. Of the 83 projects, 64 were prescriptive and 19 were comprehensive. The prescriptive projects generated 0.922 GWh and 0.500 MW in net electrical energy and peak demand savings respectively, which represented a 31% and 29% decrease respectively compared to 2023 levels. Comprehensive projects generated 0.237 GWh and 0.070 MW in net electrical energy and peak demand savings, which represented an 85% and 89% increase respectively compared to 2023 levels. Together, AMH paths generated 21% and 23% fewer electrical energy and peak demand savings respectively. Electrical energy savings per project were similar for both paths, with 14.4 MWh per prescriptive project and 12.4 MWh per comprehensive project.

**2024 AMH-Finding: Following project reviews, the Evaluator made an overall upward adjustment to electrical energy savings and a downward adjustment to peak demand savings.**

The 2024 AMH project reviews led to two adjustments for electrical energy savings. The first was a 1.016 adjustment ratio applied to prescriptive heat pump projects to compensate for a change in residential full-load hour values when switching from the HSPF factor to the HSPF2 factor. Since E1 will implement the updated full-load hours in 2025, the adjustment ratio for all prescriptive heat pump projects was only applied in the 2024 evaluation and thus will not be applied in future evaluations. The second was a one-time adjustment to comprehensive projects mainly due to improper modelling of interactive effects and a non-implemented measure that was not removed in the final model. Both adjustments mostly cancelled each other, overall resulting in only a negligible difference between the tracked and evaluated electrical energy savings.

For peak demand savings, the project reviews led to two one-time adjustments. The first was because of adjustments to the peak coincidence factors of certain prescriptive lighting projects. The second was an adjustment to comprehensive projects to reflect the adjustment made to electrical energy savings.

**2024 AMH-Finding: The evaluated net electrical energy savings and peak demand savings were nearly the same as the savings tracked by E1.**

The net evaluated electrical energy savings were nearly the same as the energy savings tracked by E1 and the net evaluated peak energy savings were 2% lower than the peak demand savings tracked by E1. These differences are due to the adjustments applied by the Evaluator following the project reviews.

## 6 ASFH Overview

This section describes the Affordable Single-family Homes (ASFH) program component, follows up on past evaluation recommendations, and provides an overview of participation history.

### 6.1 ASFH Description

ASFH provides energy efficient retrofits and heat pump installations to income-qualified Nova Scotian owners of both electrically heated and non-electrically heated homes at no cost to participants. The program component is marketed under the HomeWarming brand and mainly provides building envelope measures such as draft-proofing and insulation for basements, crawl spaces, exposed floors, main walls, and attics. Heat pumps and smart thermostats are also offered under ASFH. Moisture management measures such as bathroom fans, dehumidifiers, and dirt floor coverings may also be provided. Retrofits are selected and implemented on a case-by-case basis.

ASFH also serves to identify opportunities to replace old appliances (dehumidifiers, refrigerators, and freezers) with energy efficient models and facilitates these replacements internally through the E1 Appliance Retirement program component. These are herein referred to as Appliance Replacement measures. Appliance Replacement results were integrated into ASFH reporting in 2023; those results were previously included in Appliance Retirement reporting.

HomeWarming has evolved to provide energy efficiency services for both electrically and non-electrically heated homes. Initially launched in 2012, HomeWarming focused on non-electrically heated homes through government funding, while ASFH, introduced in 2023, targets homes primarily heated with electricity using DSM-approved funding.

Starting on 1 January 2023, E1 assumed full responsibility for HomeWarming delivery, regardless of heating source, and introduced a heat pump only stream for past participants to apply for the new heat pump measure, excluding an energy assessment and additional building envelope upgrades.

ASFH is supported across Nova Scotia by seven delivery agents (DAs) and 43 heat pump contractors who conduct most of the field work. DAs use energy advisors (EAs) to perform pre-retrofit and post-retrofit energy assessments. Pre-retrofit assessments (D assessments) serve to examine the house, provide homeowners with a better understanding of how their house functions in relation to space heating, and identify applicable energy efficient upgrades to be implemented. EAs generate home energy assessment reports that provide a high-level overview of energy usage and send them to homeowners. DAs then recommend retrofits to E1 and complete those approved by the latter. Lastly, EAs conduct post-retrofit assessments (E assessments) to verify implemented measures and provide a final EnerGuide rating calculated using HOT2000, a simulation tool developed by Natural Resources Canada (NRCAN). In the heat pump only stream, heat pump contractors conduct an initial home visit and make recommendations for the heat pump measure to E1. Once approved by E1, the heat pump contractor manages the installation of the heat pump and any electrical upgrades required to facilitate the installation.

Figure 15 below illustrates the participation process.

**Figure 15: ASFH Participation Process Summary**

ASFH participants are also eligible for the Efficient Product Installation (EPI) program component through which energy efficient products are installed at no cost to participants. ASFH participants are internally referred to EPI and generally participate in EPI before receiving a pre-retrofit energy assessment under ASFH.

HomeWarming participants who currently heat their homes with oil can also take advantage of funding available through the Oil to Heat Pump Affordability (OHPA) program to transition from oil systems to electric cold climate heat pumps if they meet OHPA program eligibility criteria (e.g., minimum annual oil usage). OHPA is a federal government program delivered through specific Efficiency Nova Scotia programs. Some ASFH participants who receive DSM support and have electric savings, may also be eligible for the OHPA program and participate in both (e.g., this can be seen when a home has electric and oil heating)

ASFH was aimed at achieving 2.825 GWh in net electrical energy savings and 1.046 MW in net peak demand savings at the generator in 2024.

## 6.2 Follow-up on Past Evaluation Report Recommendations

No recommendations were made for ASFH in the 2023 evaluation.

## 6.3 Participation History

For ASFH, participation is defined as participants (homes) that have completed a project and have positive electrical energy savings, participants that completed a project with no savings, and all participants that had an initial assessment but no final assessment. As presented in Figure 16 below, 1,210 homes participated in ASFH in 2024, nearly five times more participants than in 2023. Building envelope measures were installed in 880 of those homes, with 696 of them also having a heat pump installed. In addition, 313 homes had only non-modelled measures installed. More precisely, 254 homes had a non-modelled heat pump installed and 79 had non-modelled smart thermostats installed, while 20 of these homes also had modelled savings.<sup>14</sup> The figure below also illustrates a 48% decrease in average savings per participant compared to 2023 levels, which was mainly due to the updated adjustment ratios for modelled savings from the HEA billing analysis and the different mix of projects, notably more projects only with smart thermostats or non-modelled heat pumps. Furthermore, 43 appliances were replaced.<sup>15</sup>

Among the 17 homes without energy savings, 15 homes had equal or higher energy consumption in the final assessment,<sup>16</sup> resulting in no modelled energy savings for those participants, and two were discontinued participants.

**Figure 16: Overview of ASFH Participation, 2023-2024**

Figure 17 below provides an overview of the evolution of ASFH gross electrical energy and peak demand savings since inception in 2023. Total 2024 ASFH gross energy and peak demand savings were respectively 158% and 233% higher than in 2023 mainly due to the increase in participation.

<sup>14</sup> In Figure 2, participants with both modelled and non-modelled savings are included under Number of Participants with Modelled Energy Savings.

<sup>15</sup> Appliance replacements are not added to the participation numbers since these replacements occur after ASFH participation is completed, so those participants are already included as participants.

<sup>16</sup> Zero and negative savings related to the level of accuracy of the measurement tools used during the pre and post-assessments as well as environmental factors that impacted blower door tests.

**Figure 17: Evolution of ASFH Gross Savings, 2023-2024**

## 7 ASFH Evaluation Approach

The 2024 evaluation consisted of a condensed impact evaluation and a process evaluation. The main objectives of the 2024 ASFH evaluation were as follows:

- › Collect information on program staff, partner, and participant perspectives
- › Calculate gross and net ASFH results, namely electrical first-year and lifetime energy savings, peak demand savings, as well as avoided greenhouse gas (GHG) emissions

The Evaluator identified key research questions aimed at achieving the above objectives. Table 14 outlines the evaluation objectives and maps them to the Evaluator's research questions, methods, and sample sizes (n). Each method is described further below.

**Table 14: 2024 ASFH Evaluation Approach**

| Evaluation Objectives                                                       | Research Questions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Methodology                                                                                                                                                                                 |
|-----------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| Calculate net results                                                       | <ul style="list-style-type: none"> <li>› What are the evaluated first-year and lifetime net electrical energy and peak demand savings?</li> <li>› What are the net GHG emission reductions in CO2 eq?</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <ul style="list-style-type: none"> <li>› Use of a net-to-gross ratio (NTGR) of 1</li> <li>› Calculations using evaluation results</li> <li>› GHG emission reduction calculations</li> </ul> |

## Participant Survey

A total of 60 ASFH participants took part in a telephone survey administered by Narrative Research in October and November 2024. A segment of 30 previous ASFH participants had only a heat pump installed (hereafter referred to as heat pump only participants); another segment of 30 participants underwent energy modelling (hereafter referred to as modelled participants). The average interview duration was 13.6 minutes. The aim of the survey was to understand participant experiences and perspectives on the ASFH. The survey questionnaire is presented in Appendix VII, and complete survey results are outlined in Appendix VIII.

Table 15 presents the survey time, sample sizes, as well as corresponding margins of error at a 90% confidence level. It should be noted that the margins of error are high due to low population sizes.

**Table 15: 2024 ASFH Survey Sample Sizes and Margins of Error**

| Measure          | Population at Time of Survey | Sample Size | Sample Margins of Error at 90% Confidence Level | Average Survey Duration |
|------------------|------------------------------|-------------|-------------------------------------------------|-------------------------|
| Heat Pump Only   | 160                          | 30          | ±13.6%                                          | 13.6 minutes            |
| Energy Modelling | 576                          | 30          | ±14.7%                                          |                         |
| <b>Total</b>     | <b>736</b>                   | <b>60</b>   | <b>±10.2%</b>                                   | <b>13.6 minutes</b>     |

## Interviews with Heat Pump Contractors

In November 2024, Narrative Research conducted five interviews with heat pump contractors involved in ASFH to obtain their perspectives on program delivery. The guide used for the contractor interviews is presented in Appendix IX.

## Interviews with DAs

In October and November 2024, Econoler conducted four interviews with DAs involved in ASFH to obtain their views on the program component, the effectiveness of delivery, and their suggestions for improvements. The guide used for the DA interviews is presented in Appendix X.

## Tracking Sheet Audit

Prior to performing the savings calculation review, the Evaluator performed an audit of the final 2024 tracking sheet to ensure it was complete and the entered data were consistent. The detailed protocol used for the tracking sheet audit and the results obtained are presented in Appendix XI.

## Unitary Savings Review

A unitary savings review was conducted for all measures (excluding modelled savings) as part of a major update to the 2024-2025 Demand-side Management Measure Assessment (DSM MA).<sup>17</sup> The unitary savings review entailed a literature review of technical reference manuals, metering studies, and program evaluations to determine if there were more appropriate<sup>18</sup> methodologies or parameters to be applied to calculate energy and peak demand unitary savings, including elements such as baseline assumptions, operating hours, efficiency levels, peak demand-to-energy ratios, and interactive effects factors. Modelled savings were adjusted using the adjustment ratios established for HEA in the 2024 evaluation through a billing analysis.

## EUL Update

The Evaluator conducted a review of all EUL values as part of the 2024-2025 DSM MA update in 2024 to determine whether there were more appropriate EUL estimates.

## Calculations Using Evaluation Results

Building on all the above methods and collected data, the Evaluator calculated the first-year and lifetime energy and peak demand savings using the equations and parameters that were determined to be valid for this evaluation.

## GHG Emission Reduction Calculations

To obtain net avoided GHG emissions in CO<sub>2</sub> eq for ASFH, the Evaluator multiplied net energy savings by the latest Nova Scotia-specific factor for GHG emissions generated by electricity production. This factor was established using Nova Scotia Power (NS Power) data.

---

<sup>17</sup> The 2024-2025 DSM MA is a reference document that provides an in-depth review of all parameters necessary to calculate the annual and lifetime gross energy and peak demand savings of most prescriptive measures and some semi-prescriptive measures offered through E1's DSM program portfolio. In addition, the DSM MA includes effective useful life values for all measures offered in E1's DSM program portfolio. For the evaluations conducted during the previous two years of the 2023-2025 DSM cycle, the Evaluator refers to the values presented in the 2024-2025 DSM MA.

<sup>18</sup> The Evaluator will judge whether new studies are more appropriate based on various factors, including but not limited by the following: The similarities between the measures implemented in the give study and E1 measures, the similarities in terms of climate or market conditions, the size of the sample studied, whether a study is recent, the quality of the study methodology, etc.

## 8 ASFH Stakeholder Perspectives

This section presents an analysis of stakeholder perspectives on ASFH. Stakeholders include ASFH participants (heat pump only and modelled participants), DAs, heat pump contractors, as well as program staff. It should be noted that results with a sample size of 30 are expressed as percentages while results with smaller sample sizes are expressed as number values.

To provide context for interpreting results, the various stakeholder groups and their involvement in and experiences with the program component are presented below.

### Modelled Participants

Modelled participants go through the entire ASFH process as described in Subsection 6.1 above. They receive an initial home visit and energy assessment from an EA, obtain their approved energy efficiency upgrades from a DA, and receive a final audit assessment after installation. A DA manages the given project throughout the different program stages.

### DAs

A total of four DAs were interviewed for this process evaluation, three of whom began their involvement in January 2023 and one of whom already had experience delivering HomeWarming for the province. Overall, seven DAs manage the modelled participants as they navigate through the program component. It is worth noting that DAs typically have experience delivering many types of energy efficiency programs.

### Heat Pump Only Participants

As mentioned in the program component description (Subsection 6.1) above, since January 2023, past participants of HomeWarming can apply for the heat pump only measure, which excludes an energy assessment and additional building envelope upgrades. E1 contacts these participants directly to inquire about their interest in participation. If interested, they receive an initial visit from a heat pump contractor who makes a heat pump recommendation to E1, carries out the installation, and manages the project. Considering this context, certain interview questions were not asked to heat pump only participants (including questions on program awareness, and satisfaction with specific aspects that were not applicable to their situation).

### Heat Pump Contractors

Heat pump contractors began their direct involvement in the heat pump only path of the program component in January 2023. Overall, 43 contractors support heat pump only participants. According to E1, this program component path has taken some time to ramp up due to high demand and the large number of required contractors with varying levels of knowledge about and engagement with ASFH.

The following analysis has been divided into sections for each program path (modelled and heat pump only), which cover topics such as motivations for participation in ASFH, satisfaction with the program component, and challenges by stakeholder group followed by an overview of ASFH strengths and challenges as well as suggestions for program improvement.

## 8.1 Modelled Path

### 8.1.1 Modelled Participants

#### Awareness About ASFH

Modelled participants mainly learned about ASFH through **word of mouth** (40%) and **social media** (40%). **Online channels** in general were also an important source of awareness about the program (23%).<sup>19</sup>

**Figure 18: Sources of Program Awareness, 2024 (Unaided) – Modelled Participants**

#### Motivations for Participating in ASFH

Modelled participants mainly wanted to participate in ASFH to **save on energy or reduce energy costs** (60%). Distant seconds were the intention to upgrade or replace a heating system (13%) and upgrade or install insulation/draft-proofing (13%).

<sup>19</sup> Note that heat pump only participants, who had taken part in the government funded HomeWarming program, were contacted by E1 directly about the possibility of installing a heat pump; therefore, were not asked this question.

**Figure 19: Main Reason for Participation, 2024 (Unaided) – Modelled Participants**

## Satisfaction With ASFH

In terms of overall satisfaction with ASFH, modelled participants generally appear **highly satisfied** on average (8.9), with over three-quarters (77%) providing a rating of 8, 9, or 10 out of 10 (see Figure 20 below). Modelled participants are highly satisfied with the ASFH enrollment process (93%), the quality of the installation work (87%) and the quality of the products installed (80%). Satisfaction is slightly lower in terms of the information received about the different program steps (73%) and the information about the products installed (67%).

Satisfaction is also lower with the wait times between the various program stages. This is particularly evident between the moment a participant enrolls and the time the initial home energy assessment takes place: only one in two (53%) modelled participants appears highly satisfied with this waiting period. Satisfaction with the wait time between the initial home energy assessment and the installation work is not as problematic (73%). E1 staff recognize that it has taken a long time for ASFH to be ramped up and build capacity and that there can be lengthy wait times. Keeping pace with the volume of applications – particularly since the significant increase in participation due to the announcement of free heat pumps by the provincial government in 2022 – and managing the large number (43) of heat pump contractors involved is challenging for E1 staff. That said, additional staffing resources have led to the application backlog gradually decreasing, and E1 staff are focussing their efforts on communicating with participants to update them on their application status.

**Figure 20: Satisfaction with ASFH Program Elements, 2024 – Modelled Participants**

Modelled participants are **generally highly satisfied** with the **communications and service provided by contractors and EAs** throughout all program stages (see Figure 21 below). Participants appreciated the interactions and communications to schedule appointments and organize the installation upgrades with contractors, interactions with EAs, and the installation services provided.

**Figure 21: Satisfaction with Contractor/EA Interactions/Communications, 2024 - Modelled Participants**

As illustrated in Figure 22 below, 70% of modelled participants agreed that they received information about the products installed, while over one in 10 (13%) did not, which could go some way to explaining the lower satisfaction score for this aspect (see Figure 21 above). One in 10 (10%) modelled participants said they did not receive all the upgrades they had expected and approximately one in 10 (13%) did not learn about their home's energy usage during the initial home energy assessment.

**Figure 22: Level of Agreement with Statements About ASFH Information, 2024 – Modelled Participants**

The majority (73%) of modelled participants agreed that their **home is more comfortable** following the installation of energy-efficient upgrades. For those able to answer the questions, the average results<sup>20</sup> demonstrate that they agree they can keep their home warmer (9.2) and are spending less on heating (8.3). Finally, one in three (33%) modelled participants said they can now utilize previously less comfortable spaces in their home.

**Figure 23: Level of Agreement with Statements About ASFH Benefits, 2024 – Modelled Participants**

When asked whether they had experienced additional benefits through ASFH, six modelled participants answered affirmatively. Overall, the top three additional benefits experienced are savings/spending less money (n=3), air conditioning (n=2), and better warming capabilities (n=2).

Conversely, when asked whether they had experienced additional issues since the installation of their upgrades, four modelled participants said that they had. Overall, the main additional issues mentioned were poor quality upgrades/work done (n=2), poor communication/unable to reach anyone/get in contact (n=1), and poor customer service (n=1).

Despite the above issues, roughly nine in 10 surveyed modelled participants agree that it is **worthwhile participating** in ASFH (90%) and that it is **easy to participate** (97%), a positive outcome for the program component.

<sup>20</sup> Average results exclude "Don't know" and "Refused" responses.

**Figure 24: Level of Agreement with Statements About the Nature of ASFH, 2024 – Modelled Participants**

## Net Promoter Score

The overall Net Promoter Score (NPS) for ASFH among modelled participants is 77, suggesting that the majority would be likely to recommend the program component to someone in their entourage.

**Figure 25: Likelihood of Recommending ASFH, 2024 – Modelled Participants**

## 8.1.2 Delivery Agents

### Satisfaction

Overall, most interviewed DAs are satisfied with the program (7.5 on average), as illustrated in the figure below. The **participation levels** (9.8) as well as the **quality** (9.3) of the upgrades are the program elements with the highest satisfaction levels. **Communications with E1** (7.3) and the **range of upgrades** included (7.0) are satisfactory according to this stakeholder group.

**Figure 26: Satisfaction with ASFH Program Elements, 2024 – Delivery Agents**

**Dissatisfaction** among some DAs primarily stems from **issues with the data/record keeping and reporting process to E1** (5.3) and the **user-friendliness of the software tools** (the CIS and SharePoint) (5.8) used to deliver and manage the program component and that contribute to program administrative burdens. All DAs mentioned the time-consuming manual processes of preparing documentation using SharePoint to upload files and using the CIS to fill out the required forms. Specifically, having to use two platforms leads to repetitive data entry and unclear requirements. Separate manual invoicing (required due to the incompatibility of DAs' accounting software with the CIS) is said to create redundancy, errors, and discrepancies and leads to delays. It was reported that many changes to the processes that DAs need to follow have occurred since the original training on the system and have not been formally communicated. All DAs mentioned needing a lot of back and forth with E1 to sort out problems.

Finally, among interviewed DAs, there is some dissatisfaction with the fact that marketing materials and tools are not currently provided (5.8). It should be noted that E1 had decided not to create any new marketing materials due to already high demand for the program component.

While DAs generally **do not find ASFH easy to deliver**, they widely agree that **it is worthwhile being involved** in the delivery of the program component.

## Other Challenges Per Program Step

DAs were asked to identify their experience with each step of the ASFH process, both for them and from the perspective of participants. E1 staff and participant observations are included in the following subsections, where relevant.

### Receiving Participant Information from E1

Mixed opinions were offered regarding the process for receiving information about participants interested in ASFH. DAs say they receive list updates directly from E1 every two weeks. While information provided through SharePoint is generally said to be accurate and detailed, some challenges were noted.

Two DAs mentioned that there is sometimes a lack of consistency in the number of leads they receive (since E1 does not always have applications to dispatch to them), making it difficult to ensure adequate staffing and minimal delays in program delivery as well as creating logistical and cost challenges.

Other single mentions from DAs with respect to lead information challenges include:

- › Preferring to get one big list upfront, instead of in smaller batches, to plan for resource allocation
- › Receiving leads from a single geographical area not effective since resources are distributed across the province
- › Incorrect participant details (e.g. the wrong address, especially in rural areas where street names have changed, or deceased persons associated with the property on the lead list)
- › Wanting to receive more information on participant home heating/ducting/electrical systems to better prepare for the initial home visit

### Initial Visit with Participant

DAs believe that the initial visit to complete the energy assessment is generally a simple and easy process to complete. However, DAs observe that it can be more problematic for homeowners who have limited knowledge and understanding about ASFH. DAs notice that some participants are unaware of program processes and eligible measures and/or are confused between ASFH and OHPA.

DAs say that challenges arise with respect to program intake because participants may be considering participation in multiple programs such as ASFH and OHPA. The program that participants choose to participate in can influence timelines and eligible products. For example, a participant may be eligible for either a single zone heat pump system (through ASFH) or a whole home multi-zone system (through OHPA). Participation in the OHPA program may require some participant financial outlay which can lead to the participant choosing to participate in only the ASFH program. E1 staff report having to manage some overlap between the two program components, which can be challenging for them. DAs would like E1 to confirm which program stream a participant wants to enroll in and to share that information with them.<sup>21</sup>

---

<sup>21</sup> Since the interviews were conducted, E1 has introduced a step to confirm that the participant understands the stream that they have applied to prior to the initial DA or contractor visit.

Finally, interviewed DAs mentioned that among the biggest issues they have to deal with are schemes whereby fraudsters pose as program contractors and scam vulnerable people. There has been a lot of awareness raised about this issue across the province (and there is also a mention on E1's website), which has made participants hypervigilant and mistrustful. DAs currently provide participants with more context about the name of the contractor assigned to the installation (name, phone number), but scammers continue to operate, and participants remain on high alert.

### **E1 Approval Process**

Once a proposal is submitted, E1 reviews and approves the proposed upgrades. The review process is considered too long by DAs, often taking months and upward of six months in some instances. DAs say they are not informed of E1 timelines or delays, so it is difficult for them to provide clear updates to participants. E1 staff recognize that there have been delays in their processes but that things are improving.

### **Installation of Upgrades**

Once a project is approved, the DA informs the modelled participant and organizes and completes the approved upgrade installations. This step mostly occurs without any major hitches. As illustrated in Figure 20, participants are highly satisfied with the quality of the installation work and products installed.

There are a few cases, however, in which frustrations can occur:

- › For large upgrades, DAs say that participants can become irritated if they do not have access to home heat for a day or two during the installation, forcing them to make alternative living arrangements at their own expense.
- › DAs mention that participants can cause delays when they reschedule installation dates and that heat pump installation bottlenecks can occur due to high demand or a lack of certified installers.
- › Instances whereby participants must bear part of the cost of the upgrades (through the OHPA stream) cause frustration among DAs, contractors, and participants. DAs or contractors are left to explain this situation to homeowners, and, at times, they need to address participants' annoyance.

DAs report a good working relationship with E1 whose staff try to iron out any problems when they occur throughout the delivery process in terms of both administrative hiccups (e.g. wrong or missing information) and at the participant's home (e.g. one DA mentioned that E1 has worked with participants to assist them in moving their belongings). DAs mention that participants sometimes decide to discontinue participation when the installation is not exactly what they expected (e.g. spray foam/cellulose can be refused once people fully understand that they have to clear out their basement/attic or leave their home for a short period). EAs provide participants with explanations about the upgrades as well as information pamphlets and tell them what is expected of them, but upgrades may still be refused.

### **8.1.3 Participant Questions and Concerns**

A majority of modelled participants (63%) does not have questions about energy efficiency or the technologies installed through ASFH. For the minority that does, questions tend to revolve around how to operate the given heat pump or other efficiency upgrades available. This observation was also made by DAs who highlight participants' need to understand the functionality of the mechanical systems (heat pumps, thermostats, and water heaters), maintenance requirements, and operating costs. Additionally, interviewed DAs mention that they receive questions from participants about warranties.

DAs report that, even though contractors leave instructions or a manual and have explained to participants how their heat pump works, it is still difficult for some people to fully understand, especially the elderly.

When it comes to participants' preferred method of having their subsequent questions answered, the majority says over the phone, either with their DA/contractor or through a dedicated phone number.

## 8.2 Heat Pump Only Path

### 8.2.1 Heat Pump Only Participants

#### Motivations for Participating in ASFH

The main reason heat pump only participants wanted to take part in the program component was to **save on energy or reduce energy costs** (50%). Other explanations, following far behind, included the intention to upgrade or replace a heating system (13%), the fact that the heat pump installation was free (10%), or for environmental reasons (10%).

**Figure 27: Main Reason for Participation, 2024 (Unaided) – Heat Pump Only Participants**

#### Satisfaction With ASFH

In terms of overall satisfaction with ASFH, heat pump only participants appear **highly satisfied** on average (9.4), with over nine in 10 (93%) participants providing a rating of 8, 9, or 10 out of 10.

As illustrated in Figure 28 below, heat pump only participants are very content with the quality of the installation work (97%) and the quality of the products installed (90%). Satisfaction is slightly lower in terms of the information received about the program steps (67%). Although the majority is satisfied, about one in 10 participants are dissatisfied with the information they received about the products installed (13%) and the information they received about heat pump utilization (10%).

**Figure 28: Satisfaction with ASFH Program Elements, 2024 – Heat Pump Only Participants**

Heat pump only participants are **highly satisfied** with the **communications and service provided by contractors** (see Figure 29 below). Participants appreciate the ease of scheduling appointments and the installation services provided.

**Figure 29: Satisfaction with Contractor/EA Interactions and Communications, 2024 – Heat Pump Only Participants**

As illustrated in Figure 30 below, heat pump only participants generally agreed that they received information about the products installed (87%). That said, three in 10 (30%) still have some doubts about how to operate and maintain their new equipment, which might be a barrier to ensuring proper heat pump use.

**Figure 30: Level of Agreement with Statements About ASFH Information, 2024 – Heat Pump Only Participants**

The vast majority (87%) of heat pump only participants agree that their home is more comfortable following the installation of energy efficient upgrades (see Figure 31). While significant proportions of participants were unable to determine whether they can keep their home warmer in winter and whether they are spending less money to heat their homes, the average results<sup>22</sup> demonstrate that those who were able to respond generally agree with these statements (8.8. and 7.9 respectively). Finally, thanks to their newly installed air-source heat pump (ASHP), a minority of heat pump only (43%) participants say they can now utilize previously less comfortable spaces in their home.

**Figure 31: Level of Agreement with Statements About ASFH Benefits, 2024 – Heat Pump Only Participants**

<sup>22</sup> Average results exclude "Don't know" and "Refused" responses.

When asked whether they had experienced additional benefits through ASFH, four in 10 heat pump only participants (n=13) answered affirmatively. Overall, the top three additional benefits are air conditioning (n=4), savings/spending less money (n=2), and air quality improvements (n=3).

Conversely, when asked whether they had experienced additional issues since the installation of their upgrades, only a few (n=3) participants said that they had. The issues mentioned by these participants were poor communication/unable to reach anyone/get in contact (n=2) and poor-quality upgrades/work done (n=1).

Roughly nine in 10 or more surveyed heat pump only participants agree that it is **worthwhile participating** in ASFH (97%) and that it is **easy to participate** (87%), a positive outcome for the program component.

**Figure 32: Level of Agreement with Statements About the Nature of ASFH, 2024 – Heat Pump Only Participants**

## Net Promoter Score

As illustrated below, the Net Promoter Score (NPS) is a tool that measures customer experience and overall perceptions about a brand or program. The NPS divides responses into three categories, “Promoters” who provide ratings of 9 or 10, “Passives” who provide ratings of 7 or 8, and “Detractors” who provide ratings of 6 or lower. Calculating the NPS involves subtracting the percentage of detractors from the percentage of promoters. The NPS can range from a maximum score of 100 (if everyone is a “Promoter”) to a minimum score of -100 (if everyone is a “Detractor”). The higher the NPS score, the better.

The overall NPS for ASFH among heat pump only participants is 87, a strong result indicating that participants are highly likely to talk about the program component with people they know.

**Figure 33: Likelihood of Recommending ASFH, 2024 – Heat Pump Only Participants**

## 8.2.2 Heat Pump Contractors

### Satisfaction

Overall, most interviewed heat pump contractors are **generally satisfied** with the program (7.0 on average), as illustrated in the **Figure 34** below. The selection of eligible heat pumps (9.0) and the quality of the products installed (8.2) as well as the benefits of being an **Efficiency Preferred Partner** (9.3) are the elements generating the most satisfaction.

**Figure 34: Satisfaction with ASFH Program Elements, 2024 – Heat Pump Contractors**

As with DAs (see Section 8.1.1), **dissatisfaction** among some heat pump contractors primarily stems from **issues with the data/record keeping and reporting process to E1** (5.4) and the **user-friendliness of the software tools** (the CIS and SharePoint) (5.2) used to deliver and manage the program component. All heat pump contractors mentioned the time-consuming manual processes of preparing and uploading documentation.

Heat pump contractors also notably mention **untimely responses** from E1 to email enquiries (n=5), a lack of direct access to a contact person or mailbox (n=3) (although a mailbox is currently in operation for contractors), and no notifications when leads are posted (n=2).<sup>23</sup> Finally, as with interviewed DAs, there is some dissatisfaction among heat pump contractors with the lack of marketing materials and tools (n=2).

Similarly to DAs, contractors generally **do not find ASFH easy to deliver** but widely agree that **it is worthwhile being involved** in the delivery of the program component.

## Other Challenges Per Program Step

### Receiving Participant Information from E1

At this step, heat pump contractors are most concerned with the time required to regularly monitor SharePoint for new leads. They say that this can delay the program delivery process.

### Initial Visit with Participant

The interviewed heat pump contractors, similar to the interviewed DAs, believe that the initial visit to complete the energy assessment or size a heat pump is generally a simple and easy process to complete. As with DAs, heat pump contractors also observe that it can be more problematic for homeowners who have limited knowledge and understanding about ASFH.

### E1 Approval Process

The review process is considered too long by heat pump contractors (as with DAs). Heat pump contractors mention that, since they are not notified by email of E1's decisions on applications or questions, they must constantly monitor SharePoint to consult the status of their files. E1 staff recognize that there have been delays in their processes but that things are improving.

## 8.2.3 Participant Questions and Concerns

A majority of heat pump participants (70%) does not have questions about energy efficiency or the heat pump installed through ASFH. As with modelled participants, questions tend to concern heat pump operations. Heat pump contractors highlight participants' need to understand the functionality of the heat pump, maintenance requirements, operating costs, and warranties. It should be recalled that 30% of heat pump participants were not fully aware of how to operate and maintain their equipment (see Figure 30 above).

Following the completion of the upgrades, all interviewed heat pump contractors report reviewing with participants how to operate the heat pump and basic maintenance requirements, including how to change the filter and operate the thermostat controls. All contractors say they leave the instruction manuals with participants, with some also leaving other documents with them, including warranty information and the E1 materials that describe how to operate a heat pump system and what to expect from it. Participants can be directed to their contractors' website for additional information on heat pumps.

---

<sup>23</sup> It should be noted that E1 is now communicating with contractors in advance on the number of leads that they will be getting and sending leads at specific intervals together with a notification.

When it comes to participants' preferred method of having their subsequent questions answered, the majority says over the phone, either with their contractor or through a dedicated phone number.

### 8.3 Overview of ASFH Strengths and Challenges

The following provides a summary of the ASFH delivery process key strengths and challenges.

#### **ASFH Strengths:**

- › Participants are appreciative of the program and upgrades
- › Good relationships between DAs and E1
- › EAs comfortable with modelling software
- › Quality of products installed
- › Quality of installation work
- › Enhances vulnerable homeowners' home comfort
- › Ability to keep home warmer in winter

#### **ASFH Challenges:**

- › The software tools used to manage/deliver the program require more training, communications, and efficiencies to reduce administrative burden (DAs and contractors)
- › Existence of scams leads to participant mistrust of program contractors
- › Confusion between ASFH and OHPA
- › Perceived lack of information on different program steps and products installed
- › Long E1 processing times and approval process
- › Untimely communications between E1 and heat pump contractors on queries and follow-up

## 8.4 DA and Heat Pump Contractor Suggestions for Improvements

DAs and heat pump contractors make the following suggestions for program improvements:

- › **Simplify/streamline the administrative process** throughout delivery and **improve the user-friendliness of CIS** by:
  - › Improving E1 processing times (by adding more staff)
  - › Removing the need for manual input (system automation)
  - › Allowing batch uploads
  - › Allowing copy-paste functionality
  - › Including search and filter options
  - › Releasing updated guidelines to help fix recurring errors
  - › Simplifying the invoice format to align with DAs' and contractors' existing accounting software

Additionally, heat pump contractors would like to access **simplified training on program delivery steps and administrative requirements**, including how to prepare a proposal submission and how to size heat pumps. They also suggest that changes to the delivery process be minimized in the future for consistency over time. Webinars and short how-to videos are considered accessible and convenient ways of delivering information and training. Two contractors suggested that E1 partner with the Heating, Refrigeration and Air Conditioning Institute of Canada (HRAI) to deliver more technical training.

Heat pump contractors and DAs made suggestions to **improve communications** throughout the ASFH delivery process. These include:

- › Improving E1 responsiveness to heat pump contractor questions and communications (suggestion of a designated contact person)
- › Having notification emails to save contractors time monitoring SharePoint/informing contractors of lead projections
- › Setting up a portal for participants to monitor their application progress and communicate directly with E1

On this last point, the introduction of a participant portal would facilitate communications, and some DAs and contractors say they would like E1 to provide a handout that explains the program component, timelines, responsibilities of each party involved, and E1 contact information. This would also help overcome fraud and participant mistrust. It should be noted that E1 already has several communication touchpoints including a welcome letter and further communications should the waiting period be longer than four weeks. After a participant has been assigned to a DA or contractor, the DA or contractor becomes the main point of contact and resource for questions.

DAs suggest **raising program awareness** among the target audience using more traditional routes as well as electronic ones, providing more **clarity and distinction** between different programs. It should be noted that over one in 10 (13%) modelled participants would like more information in general about ASFH. While there is a lot of information about ASFH on social media, other communications channels, such as bill inserts or letters, could work better to inform older people according to DAs.

Finally, two DAs also suggest **improving education** to explain how products are used through more of a grassroots approach in communities. It was mentioned that sending information to and working with local Members of the Legislative Assembly (MLAs) could be helpful, particularly as many seniors are in contact with them.

## 9 ASFH Impact Evaluation

The objectives of the 2024 ASFH impact evaluation were to determine gross and net electrical energy and peak demand savings, annually avoided GHG emissions, as well as the effective useful life (EUL) values and associated lifetime energy savings.

### 9.1 Tracking Sheet Audit

To ensure program component results were reliably compiled, the Evaluator first performed a tracking sheet audit aimed at verifying the completeness and consistency of the data submitted by E1 as well as correcting the tracked savings as needed. The results are provided in Appendix XI. The tracked savings results presented in this report therefore refer to the corrected tracked savings obtained by the Evaluator.

### 9.2 Gross Savings

For ASFH, the gross savings associated with building envelope and heat pump measures are calculated based on pre-retrofit and post-retrofit HOT2000 simulations, while the gross savings of replaced old appliances through the E1 Appliance Retirement program component (dehumidifiers, refrigerators, and freezers) and smart thermostats are calculated using unitary savings values. Gross electrical energy savings for the non-modelled heat pump only measure were determined using the Green Heat calculation approach whereby the specifications of each heat pump were used to obtain energy savings. This subsection describes the methodology used to review ASFH gross savings for 2024.

#### 9.2.1 Electrical Energy Savings

For ASFH, electrical energy savings are calculated based on HOT2000 simulation results adjusted with billing analysis results and unitary savings values for prescriptive measures, as shown in the equation below.

$$\begin{aligned} & \text{Gross Energy Savings (kWh)} \\ &= \left( \frac{(Total\ Energy_D\ (GJ) - Total\ Energy_E\ (GJ))}{0.0036\ GJ/kWh} \times \%_{Elec} \right) \times AR \\ &+ \text{Savings for Non-modelled Measures (kWh)} \end{aligned}$$

Where:

- ›  $Total\ Energy_D$  and  $Total\ Energy_E$  correspond to the modelled energy consumption levels obtained in HOT2000 during the pre-retrofit (D) and post-retrofit (E) assessments respectively. Since modelled energy consumption levels were not directly available in the tracking sheet, the participant EnerGuide ratings were used, which are based on modelled whole-home consumption. Also, if the final E assessment EnerGuide rating was not available, the projected final rating was used.
- ›  $AR$  corresponds to the adjustment ratio (AR) established through a billing analysis and used to adjust the savings obtained from the difference between the modelled electrical energy consumption during the D and E assessments. ARs vary according to different space heating system scenarios. ARs were drawn from billing analyses conducted in 2024 as part of the HEA evaluation.
- ›  $\%_{Elec}$  corresponds to the percentage of electrical space heating estimated by the DA through the D assessment.
- ›  $Savings\ for\ Non-modelled\ Measures$  are obtained by multiplying the prescriptive measures installed through ASFH by their respective unitary electrical energy savings value.

The energy savings methodology for modelled and non-modelled measures is presented below in this subsection.

## Modelled Energy Savings

After the D and E assessments, the EAs model the house in the HOT2000 energy simulation software to obtain the initial and final EnerGuide ratings of that house. These ratings were used to determine the electrical energy savings for modelled measures. ASFH modelled energy savings correspond to the reduction in energy consumption between the D and E assessments.

Since 2018, the methodology used to calculate tracked savings compared electrical D and E assessment space heating consumption levels, both of which being adjusted with an overestimation ratio (OR). The ORs were drawn from billing analyses conducted during the 2015 and 2018 HEA evaluations. The 2018 evaluation served to establish distinct ORs depending on the space heating system in place.

As part of the 2024 evaluation, the Evaluator made some changes to the existing savings calculation methodology to simplify it and make it more robust. To do so, the Evaluator conducted a new billing analysis as part of the HEA 2024 evaluation. The Evaluator used the savings values obtained with billing data to develop adjustment ratios (ARs) that could be directly applied to the modelled savings estimates obtained from HOT2000 using whole-home consumption (not only space heating). The complete billing analysis methodology and results are presented in Appendix XXXI.

The ARs obtained through the HEA billing analysis performed as part of the 2024 evaluation are presented in Table 16 below. They were determined separately for three heat pump scenarios, as was the case for ORs. The tracked ORs are also presented in the table for comparison. The values in parenthesis represent the ratios  $(1 - OR)$  that were multiplied with the D and E space heating consumption values when adjusting consumption with the previous methodology. It is worth reminding that ARs are directly applied to the savings values obtained from the difference between the total initial and final consumption values.

**Table 16: 2024 Adjustment Ratios (ARs)**

| Scenario                                                                            | Tracked                    |                            | Evaluated |
|-------------------------------------------------------------------------------------|----------------------------|----------------------------|-----------|
|                                                                                     | OR <sub>D</sub> Assessment | OR <sub>E</sub> Assessment | AR        |
| A participant who registered <b>with</b> a heat pump                                | 0% (1.00)                  | 0% (1.00)                  | 1.24      |
| A participant who registered <b>without</b> a heat pump and who did not install one | 19% (0.81)                 | 19% (0.81)                 | 0.58      |
| A participant who registered <b>without</b> a heat pump and then had one installed  | 19% (0.81)                 | 0% (1.00)                  | 0.43      |

Participants with non-electrical space heating are eligible for the program component, meaning participants can generate both electrical and non-electrical savings. As indicated in the equation further above, the proportion of electrical savings for each participant is determined by multiplying total energy consumption by the proportion of space heating covered by electrical heating systems during the D assessment.

## Non-modelled Energy Savings

Smart thermostats and replaced appliances are not modelled in HOT2000. Instead, energy savings are calculated based on unitary energy savings values from the 2024-2025 DSM MA, which provides a detailed description of inputs, references, and unitary savings calculations for non-modelled measures offered through ASFH. Since the DSM MA was updated in 2024, the unitary energy savings values of ASFH measures were updated.

For participants that installed a heat pump and had no modelled energy savings, energy savings were calculated using the Green Heat calculation approach (see Subsection 19.2.2 below). The specifications of each heat pump were used to obtain energy savings.

Table 17 summarizes the tracked and evaluated unitary energy savings values for measures for which the unitary savings were changed in 2024.

**Table 17: Tracked and Evaluated 2024 ASFH Unitary Energy Savings**

| Measure                                   | Tracked Savings<br>[kWh/year] | Evaluated Savings<br>[kWh/year] |
|-------------------------------------------|-------------------------------|---------------------------------|
| Smart Thermostats with Heat Pump Baseline | 514                           | 564                             |
| <b>Appliance Replacement</b>              |                               |                                 |
| Refrigerators                             | 735                           | 674                             |
| Freezers                                  | 2,006                         | 1,380                           |
| Dehumidifiers                             | 603                           | 616                             |

## 9.2.2 Peak Demand Savings

Peak demand savings correspond to the demand savings that coincide in time with the peak demand period of the electricity system. The projected electricity peak demand period in Nova Scotia is between 5 p.m. and 7 p.m. in the months of December to February on non-holiday weekdays.

For ASFH, modelled peak demand savings were calculated based on electrical savings using a peak demand-to-energy ratio of 0.283 MW/GWh (RES-Elect Space Heat & Cool) for space heating savings, as set by Navigant in the 2016-2018 DSM Plan. This ratio was established based on the modelled system coincident peak demand savings and energy savings for a projected deployment of measures. Navigant used local data to establish the ratio. The Evaluator considered that the approach used by Navigant to establish the peak demand-to-energy ratio was still valid and therefore used it to estimate peak demand savings.

An exception was made for heat pump measures for which peak demand savings were calculated separately to ensure they were accounted for correctly. Hence, the specifications of each heat pump were used to obtain peak demand savings using the HEA calculation approach (see Subsection 23.2.3) for modeled heat pumps. When heat pumps were included in the model, peak demand savings from the modelled savings were adjusted to accurately account for the peak demand savings attributable to heat pumps. For participants that installed a heat pump and had no modelled energy savings, peak demand savings were calculated using the Green Heat calculation approach (see Subsection 19.2.3 below).

Smart thermostats and replaced appliances are not modelled in HOT2000. Instead, peak demand savings are calculated based on unitary peak demand savings values. The detailed calculations for the unitary peak demand savings of each measure installed through ASFH are presented in the 2024-2025 DSM MA. During the 2024-2025 DSM MA update, unitary peak demand savings values for replaced appliances were reviewed and updated, while the value for smart thermostats remained unchanged.

Table 18 summarizes the tracked and evaluated peak demand unitary energy savings values of measures for which those unitary savings changed in 2024.

**Table 18: 2024 Appliance Replacement Tracked and Evaluated Unitary Peak Demand Savings**

|               | Tracked Savings [W/year] | Evaluated Savings [W/year] |
|---------------|--------------------------|----------------------------|
| Refrigerators | 101                      | 93.0                       |
| Freezers      | 277                      | 190                        |
| Dehumidifiers | 202                      | 206                        |

### 9.2.3 Interactive Effects

In a home, interactive effects occur when the implementation of energy efficiency measures has an impact on the energy consumption of other factors such as heating and cooling. Since ASFH building envelope and heat pump measures target heating and cooling loads directly, the impact of these measures on heating and cooling is considered in the savings. Therefore, no additional interactive effects factors were applied to the savings of these measures.

Smart thermostats and replaced old appliances savings are not modelled in HOT2000. As indicated in the 2024-2025 DSM MA, such measures do not have an impact on the energy consumption of other elements.

### 9.2.4 Effective Useful Life

As part of the 2024-2025 DSM MA activities, the Evaluator reviewed the EUL values used in the calculation of electrical energy savings that are expected to persist over time; the EUL values were not revised for any measure categories except modelled measures (building envelope upgrades and modelled space heating equipment). The EUL value for the modelled savings is based on the measures installed by HEA participants since HEA and ASFH participants install similar measures. Table 19 presents the EUL values that were changed in 2024.

**Table 19: Tracked and Evaluated 2024 ASFH Equivalent EUL Values**

| Measure                            | Tracked Equivalent EUL [years] | Evaluated Equivalent EUL [years] |
|------------------------------------|--------------------------------|----------------------------------|
| Building Envelope (Modelled)       | 20.8                           | 20.5                             |
| Space Heating Equipment (Modelled) | 20.8                           | 20.5                             |

### 9.2.5 Evaluated Gross Savings

The annual gross savings at the meter of modelled and non-modelled measures are presented in Table 20 and Table 21 below respectively. Table 22 further below combines the savings of all ASFH measures to present ASFH total annual gross savings.

**Table 20: Evaluated 2024 ASFH Modelled Measure Gross Energy and Peak Demand Savings**

| Total                                                                                                                                                                                                                                                                                                                              |               |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|
| <b>Energy Savings</b>                                                                                                                                                                                                                                                                                                              |               |
| Gross Energy Savings Without Adjustment Ratio (AR) – at the Meter (GWh)                                                                                                                                                                                                                                                            | 4.484         |
| <b>Gross Energy Savings with AR – at the Meter (GWh)</b>                                                                                                                                                                                                                                                                           | <b>3.111</b>  |
| Effective Useful Life (years)                                                                                                                                                                                                                                                                                                      | 20.5          |
| <b>Gross Lifetime Energy Savings – at the Meter (GWh)</b>                                                                                                                                                                                                                                                                          | <b>63.777</b> |
| <b>Peak Demand Savings</b>                                                                                                                                                                                                                                                                                                         |               |
| Peak Demand-to-energy Ratio (MW/GWh)*                                                                                                                                                                                                                                                                                              | 0.483         |
| <b>Gross Peak Demand Savings – at the Meter (MW)</b>                                                                                                                                                                                                                                                                               | <b>1.501</b>  |
| * Corresponds to the equivalent peak demand-to-energy ratio obtained by dividing gross peak demand savings by gross electrical energy savings. This value differs from the peak demand-to-energy ratio mentioned in Subsection 9.2.2 above (0.283 MW/GWh) because of the different calculation methodology applied for heat pumps. |               |

| * Only measures with at least one installed unit were included in this table. |                         |                   |                        |              |               |              |

The gross savings at the generator were estimated by using a line loss factor of 1.0947 for energy savings and 1.1466 for peak demand savings between the meter and the generator. These line loss factors were provided by NS Power and correspond to the values used for residential consumers. The line loss factors correspond to the values submitted to the Nova Scotia Utility and Review Board (NSUARB) as part of the 2014 Cost of Service Study Progress Update.<sup>24</sup>

As presented in Table 22 below, appliances replaced through Appliance Replacement (refrigerator, freezer, and dehumidifier replacements) resulted in gross electrical energy savings at the generator of 0.045 GWh and gross peak demand savings at the generator of 0.008 MW.

<sup>24</sup> Nova Scotia Utility and Review Board, Matter M06555, 2014 Cost of Service Study Progress Update, Exhibit N-2.09, Appendix I1.

With total gross electrical energy and lifetime electrical energy savings of 3.719 GWh and 74.428 GWh respectively, the average EUL value for ASFH was 20.0 years in 2024.

**Table 22: Evaluated 2024 ASFH Gross Electrical Energy and Peak Demand Savings**

| Gross Peak Demand Savings – at the Generator (MW)                                                                                                                                             | 1.722             | 0.359                   | -                 | 0.008                  | 2.089  |
| *The total number of participants does not correspond to the sum of all measure categories since participants who benefited from appliance replacements also implemented additional measures. |                   |                         |                   |                        |        |
| ** Corresponds to the equivalent EUL obtained from dividing the non-modelled measure lifetime energy savings at the meter by the energy savings at the meter (see Table 21).                  |                   |                         |                   |                        |        |

As presented in Table 23, GHG emission reductions were calculated by applying the Nova Scotia-specific factor<sup>25</sup> for GHG emissions generated by electricity production to ASFH gross savings results.

**Table 23: Evaluated 2024 ASFH Gross GHG Emission Reductions**

|                                                                                             | Total |
|---------------------------------------------------------------------------------------------|-------|
| Gross Energy Savings – at the Generator (GWh)                                               | 3.719 |
| Nova Scotia-specific GHG Emissions Factor for Electricity Production (tonnes of CO2 eq/GWh) | 472.2 |
| Gross Annual GHG Emission Reductions (tonnes of CO2 eq)                                     | 1,756 |

<sup>25</sup> At the time of writing, 2024 data were not yet available. The Nova Scotia-specific factor was obtained from Nova Scotia Power's 2023 total system emissions data (4,931,152 CO2 eq tonnes), and total electricity generation (10,442 GWh) was drawn from the following two sources: Nova Scotia Power, Total System Emissions, <https://www.nspower.ca/clean-energy/air-emissions-reporting> (last accessed September 27, 2024), and Emera Inc., Emera Inc. 2023 Annual Report, p. 31, available at [https://s25.q4cdn.com/978989322/files/doc\\_financials/2023/ar/Emera\\_2023\\_AR\\_FINAL.pdf](https://s25.q4cdn.com/978989322/files/doc_financials/2023/ar/Emera_2023_AR_FINAL.pdf) (last accessed September 27, 2024).

## 9.3 Net Savings

The Evaluator determined the net energy and peak demand savings, i.e. the electrical energy and peak demand savings that can be reliably attributed to a program component, by estimating the net-to-gross ratio (NTGR). More precisely, the NTGR represents the positive or negative impacts of spillover and free-ridership effects on gross savings. For ASFH, free-ridership and spillover effects were considered to be nil since participants are non-profit organizations or low-income housing owners that traditionally have small housing budgets spread across many competing housing priorities. Therefore, a NTGR of 1.00 was applied.

### 9.3.1 Evaluated Net Savings

Net savings are defined as the changes in energy use that are specifically attributable to ASFH. Since spillover and free-ridership effects were considered nil, the net energy savings are equal to the gross savings generated by the program component. Likewise, the net annual GHG emission reductions are equal to the gross annual GHG emission reductions.

As outlined in Figure 35, ASFH exceeded its electrical energy and peak demand savings targets by 32% and 100% respectively.

**Figure 35: 2024 ASFH Targets and Evaluated Results**

## 9.4 Realization Rate

Table 24 below compares the energy and peak demand savings established through this evaluation to those calculated in the 2024 tracking sheet. It also includes the realization rate, representing the ratio of evaluated net savings to tracked net savings, for both energy savings and peak demand savings.

**Table 24: Comparison of 2024 ASFH Tracked and Evaluated Savings at the Generator**

|                       | Gross Savings |      | NTGR  | Net Savings |      | Realization Rate |
|-----------------------|---------------|------|-------|-------------|------|------------------|
|                       | Value         | Unit | Value | Value       | Unit | Value            |
| Energy Savings        |               |      |       |             |      |                  |
| Tracked Savings by E1 | 4.693         | GWh  | 1.00  | 4.693       | GWh  | 79%              |
| Evaluation Results    | 3.719         | GWh  | 1.00  | 3.719       | GWh  |                  |
| Peak Demand Savings   |               |      |       |             |      |                  |
| Tracked Savings by E1 | 2.160         | MW   | 1.00  | 2.160       | MW   | 97%              |
| Evaluation Results    | 2.089         | MW   | 1.00  | 2.089       | MW   |                  |

The electrical energy and peak demand savings determined by the Evaluator were respectively 21% and 3% lower than the initial savings tracked by E1 mainly due to the revised adjustment ratios. Updated unitary savings also partly explain the differences, although to a much lesser extent.

## 10 ASFH Key Findings and Recommendations

As mentioned previously, the main objectives of the 2024 ASFH evaluation were as follows:

- › Collect information on program staff, partner, and participant perspectives
- › Calculate gross and net ASFH results, namely electrical first-year and lifetime energy savings, peak demand savings, as well as avoided greenhouse gas (GHG) emissions

This section provides the Evaluator's key findings and recommendations in relation to the above objectives.

### **2024 ASFH-Finding: Participants see the value of the program.**

The energy efficient retrofits installed at no cost through ASFH are perceived by participants to be making their homes more comfortable and warmer in winter and less expensive to heat.

### **2024 ASFH-Finding: Overall satisfaction with ASFH is high.**

Surveyed participants as well as interviewed DAs and heat pump contractors are generally satisfied with ASFH. Participants consider it easy and worthwhile to participate and would highly recommend the program to others. Although DAs and contractors make suggestions for improvements to the program, they widely agree that it is worthwhile being involved.

### **2024 ASFH-Finding: Despite overall satisfaction, there are three irritants with the program component.**

Long wait times (participants, DAs, and heat pump contractors), insufficient program and product information (participants), and reporting processes and lack of user-friendly software tools (DAs and heat pump contractors) are causing some dissatisfaction. These are expanded upon below.

### **2024 ASFH-Finding: Long wait times cause discontent at various program stages and for various stakeholders.**

- › Modelled participants are particularly dissatisfied with the wait time between their enrollment in ASFH and the initial home energy assessment. DAs and heat pump contractors are dissatisfied with the time it takes E1 to approve proposed upgrades.
- › Additionally, heat pump contractors mention untimely responses from E1 to email enquiries, hindered by a perceived lack of direct access to a contact person or mailbox..
- › E1 is cognisant of dissatisfaction with wait times and have put strategies in place. They report that they have expanded the number of staff members and are catching up with the backlog. It should be noted that a mailbox for heat pump contractors is already available and E1 recently provided training to improve contractor knowledge about and engagement with ASFH.

**Recommendation #1:** To assess progress with participant wait times, E1 could track wait times as well as program delivery satisfaction levels (e.g. in quarterly customer satisfaction surveys) throughout 2025 to determine how strategies are performing and make adjustments if necessary.

**2024 ASFH-Finding: Participants would like more information to be provided about the program steps.**

Limited participant knowledge about ASFH can cause participant confusion and frustration during the initial DA/contractor visit, particularly if participants are considering taking part in multiple programs (such as ASFH and OHPA).

**Recommendation #2:** Provide participants with more information about ASFH to help them understand program options, eligible measures, and participation steps by implementing the following:

- a) Investigate ways to inform participants about eligible measures in ASFH and to ensure that other program options and their differences (i.e. OHPA) are clearly presented to participants verbally and through marketing materials.
- b) Review the application template for clarity and adapt it to confirm with participants to which program they are applying (i.e. ASFH, OHPA). Ensure that the information in the application is shared with DAs/contractors.
- c) Once participants have submitted their application, clearly communicate (perhaps using a visual) the touchpoints that will occur along their journey (e.g. who will be contacting them, at what point, and what to expect).

**Recommendation #3:** Reinforce participant awareness of the Energy Solution Advisor's role as E1 program navigator to help participants better understand and navigate E1's programs (including ASFH).

**2024 ASFH-Finding: More product information would be helpful for participants.**

Some participants say they did not receive information about the products installed and some still have doubts about how to operate and maintain their new equipment (especially heat pumps) even though contractors report reviewing this with participants after installation. Note that most questions fielded by DAs and contractors concern heat pump usage. This situation could potentially create barriers to proper equipment use and affect energy savings.

**Recommendation #4:** To maximize energy savings, ensure that all participants receive the necessary information to operate and maintain the equipment installed in language that is easy to understand. Implement checklists for DAs and heat pump contractors if necessary.

**Recommendation #5:** Ensure that DAs/contractors provide a leave-behind so that participants know who to contact in case of questions or difficulties or to better understand how to operate and maintain their heat pump.

## **2024 ASFH-Finding: Record keeping/reporting is time consuming.**

Having to use two platforms for filling out the required record keeping/reporting forms (CIS) and uploading documentation (SharePoint) is said to lead to repetitive data entry and unclear requirements for DAs and heat pump contractors. While SharePoint is considered to be an adequate file sharing tool, the CIS is said not to provide effective project management. Furthermore, DAs report many changes since the original training on processes and system use, which have never been formally communicated and lead to a lot of back and forth with E1 to resolve issues.

**Recommendation #6:** Look for opportunities to streamline record keeping/reporting processes to reduce the administrative burden for DAs and contractors, taking into account program tracking and evaluation needs.

**Recommendation #7:** Update the DA/contractor training guides on the record keeping/reporting processes and use of the software tools to reflect current practices and offer regular training sessions to provide updates on any changes.

## **2024 ASFH-Finding: ASFH exceeded its electrical energy and peak demand savings targets.**

ASFH achieved 3.719 GWh in net electrical energy savings and 2.089 MW in net peak demand savings at the generator in 2024, thus exceeding the planned targets of 2.825 GWh and 1.046 MW respectively. This represents electrical energy savings 32% over and peak demand savings 100% over ASFH targets.

## **2024 ASFH-Finding: In 2024, 1,210 homes participated in ASFH, nearly five times the number recorded in 2023.**

Among the 1,210 ASFH participants, 880 implemented building envelope measures, with 696 of them also installing a heat pump. Additionally, 254 participants installed a non-modelled heat pump and 79 installed smart thermostats, and a total of 43 appliances were replaced.

While gross electrical energy and peak demand savings were respectively 158% and 233% higher than in 2023 primarily due to increased participation, average savings per participant decreased by 48%. This decline was mainly attributed to updated adjustment ratios and a different project mix, with a greater number of projects involving only smart thermostats or non-modelled heat pumps.

## **2024 ASFH-Finding: The evaluated net energy and peak demand savings determined by the Evaluator were lower than the initial net savings tracked by E1.**

The energy and peak demand savings determined by the Evaluator were lower by 21% and 3% respectively compared to the initial savings tracked by E1. This was mainly due to revisions to the adjustment ratios.

## 11 EPI Overview

This section describes the Efficient Product Installation (EPI) program component, follows up on past evaluation recommendations, and provides an overview of EPI participation history.

### 11.1 EPI Description

EPI provides participants with free-of-charge direct installations of energy efficient products. EPI has played a pivotal role in transforming the residential lighting market by making energy-efficient products more affordable. Importantly, as LEDs have become the baseline, EPI is set to phase out lighting measures and focus on electrician-installed energy-efficient products. Electrician-installed measures will be key in delivering Residential Demand Response activities. E1 contracts service providers to deliver EPI across the province. EPI is available to both homeowners and renters and encourages participants to also consider other E1 residential program components. Table 25 presents the products available for installation through EPI in 2024 and whether they were aimed at generating electrical savings, non-electrical savings, or both.

**Table 25: 2024 EPI List of Eligible Products**

| Products                                                          | Electrical Savings | Non-electrical Savings |
|-------------------------------------------------------------------|--------------------|------------------------|
| <b>Lighting Products</b>                                          |                    |                        |
| LED Lamps Including A-types, Reflectors, and Chandeliers          | X                  | -                      |
| LED Nightlights                                                   | X                  | -                      |
| Solar Security Fixtures*                                          | X                  | -                      |
| Motion Sensors*                                                   | X                  | -                      |
| Dimmer Switches*                                                  | X                  | -                      |
| <b>Domestic Hot Water (DHW) Products</b>                          |                    |                        |
| Faucet Aerators                                                   | X                  | X                      |
| Low-flow Showerheads                                              | X                  | X                      |
| Thermostatic Shower Valves                                        | X                  | X                      |
| Pipe Insulation                                                   | X                  | X                      |
| Hot Water Tank Wraps                                              | X                  | -                      |
| <b>Smart and Advanced Learning Thermostats</b>                    |                    |                        |
| Advanced Learning Thermostats (for non-electrically heated homes) | -                  | X                      |
| Smart Thermostats (for mini-split heat pumps [MSHPS])*            | X                  | -                      |
| Smart Thermostats (for electric baseboards or in-floor systems)*  | X                  | -                      |
| Advanced Learning Thermostats (for central electric heating)*     | X                  | -                      |
| <b>Air Sealing Products</b>                                       |                    |                        |
| Foam Gaskets                                                      | X                  | X                      |
| Door Sweeps                                                       | X                  | X                      |
| Window Air Sealing                                                | X                  | X                      |
| Door Weather Stripping                                            | X                  | X                      |
| Window Film Kits                                                  | X                  | X                      |

| Products                                                        | Electrical Savings | Non-electrical Savings |
|-----------------------------------------------------------------|--------------------|------------------------|
| <b>Other Products</b>                                           |                    |                        |
| Smart Power Controllers for Audiovisual Equipment <sup>26</sup> | X                  | -                      |
| Domestic Hot Water Heater Load Controllers <sup>27</sup> *      | X                  |                        |
| Humidity Sensors*                                               | X                  |                        |
| * Electrician-installed measures.                               |                    |                        |

Electrician-installed measures were introduced to EPI in 2024, except smart thermostats for electric baseboards and DHW heater load controllers that were introduced with a limited scope in 2023 as well as smart thermostats for MSHP that were introduced in 2022.

EPI funding comes from two sources: (1) Electricity ratepayer funding is used for upgrades that reduce electricity consumption; and (2) funding from the Government of Nova Scotia using funds from the Green Fund for upgrades that reduce the use of other fuels. This report presents the evaluation results for the electricity ratepayer portion of EPI only.

EPI was aimed at achieving 10.569 GWh in net electrical energy savings and 1.127 MW in net peak demand savings at the generator in 2024.

## 11.2 Follow-up on Past Evaluation Report Recommendations

No recommendations were made for EPI in the 2023 evaluation.

## 11.3 Participation History

As presented in Figure 36 below, EPI had 9,993 DSM participants, which represents a 2.4% increase in participation compared to 2023.<sup>28</sup>

In 2024, 150,722 efficient products were installed,<sup>29</sup> which represents a 2% decrease compared to 2023. On average, 15.1 products were installed per household, which is similar to the average of 15.8 products installed in 2023. The average savings per participant decreased by 6.3% in 2024 compared to 2023.

<sup>26</sup> Smart power controllers for audiovisual equipment were removed from EPI in 2021. To allow service providers to use up their remaining stocks, installations were briefly resumed in January 2024 until March 2024.

<sup>27</sup> While DHW heater load controllers were installed through EPI, their savings are claimed under the Demand Response program.

<sup>28</sup> The number of participants is based on the number of unique reference numbers of participants that generated electricity savings.

<sup>29</sup> The number of efficient products installed does not include DHW controllers.

**Figure 36: Overview of EPI Participation, 2017-2024**

The average number of A-type lamps installed per dwelling decreased from 7.8 in 2023 to 7.4 in 2024 and the average number of non-A-type lamps replaced per dwelling decreased from 4.3 in 2023 to 3.8 in 2024. With 111,806 LED lamps generating 3.871 GWh in gross savings, LED lamps remained the most popular product type representing 74% of products installed in EPI and accounting for 43% of gross energy savings. Similarly to 2023, smart thermostats for MSHPs were also a significant contributor, accounting for 20% of EPI gross energy savings.

As illustrated in Figure 37 below, the 2024 gross energy and peak demand savings were slightly lower than those generated in 2023 despite the higher participation level.

**Figure 37: Evolution of EPI Gross Savings, 2018-2024**

## 12 EPI Evaluation Approach

The 2024 EPI evaluation comprised a comprehensive impact evaluation. The main objectives of the 2024 EPI evaluation were as follows:

- › Collect information on participant perspectives
- › Calculate gross and net EPI results, namely electrical first-year and lifetime energy savings, peak demand savings, as well as avoided GHG emissions<sup>30</sup>
- › Analyze market opportunities

The Evaluator identified key research questions aimed at achieving these objectives. Table 26 outlines the EPI evaluation objectives and maps them to the research questions and methods established by the Evaluator. Each method is described further below.

**Table 26: 2024 EPI Evaluation Approach**

| Evaluation Objectives                                                                             | Research Questions                                                                                                                                                                                                                                                                                                                                                                    | Methodology                                                                                                                                                                                                                                                                                           |
|---------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Collect information on participant perspectives                                                   | <ul style="list-style-type: none"> <li>› How do participants become aware of EPI?</li> <li>› What is the level of satisfaction with the program component among participants and distributors?</li> <li>› How could E1 improve the program component?</li> </ul>                                                                                                                      | <ul style="list-style-type: none"> <li>› Participant survey</li> </ul>                                                                                                                                                                                                                                |
| Calculate gross results                                                                           | <ul style="list-style-type: none"> <li>› Are the data in the tracking sheet complete, accurate, and consistent?</li> <li>› What are the unitary savings and effective useful life (EUL) values by product?</li> <li>› What is the installation rate by product?</li> <li>› What are the evaluated first-year and lifetime gross electrical energy and peak demand savings?</li> </ul> | <ul style="list-style-type: none"> <li>› Tracking sheet audit</li> <li>› Unitary savings review</li> <li>› Site visits</li> <li>› EUL update</li> <li>› Calculations using evaluation results</li> </ul>                                                                                              |
| Calculate net results                                                                             | <ul style="list-style-type: none"> <li>› What is the free-ridership level for 2024?</li> <li>› What is the spillover level for 2024?</li> <li>› What are the evaluated first-year and lifetime net electrical energy and peak demand savings?</li> <li>› What are the net GHG emission reductions in CO<sub>2</sub> eq?</li> </ul>                                                    | <ul style="list-style-type: none"> <li>› Participant survey (does not include electrician-installed measures introduced in 2025)</li> <li>› Use of a NTGR of 1 for low-income participants</li> <li>› Calculations using evaluation results</li> <li>› GHG emission reduction calculations</li> </ul> |

### Tracking Sheet Audit

Prior to performing the savings calculation review, the Evaluator audited the final 2024 tracking sheet to ensure it was complete and the entered data were consistent. The results obtained are presented in Appendix XIII.

<sup>30</sup> First-year savings are based on typical energy consumption and do not consider changes in energy consumption resulting from the COVID-19 pandemic.

## Participant survey

In October and November 2024, Narrative Research conducted a telephone survey with a total of 100 participants. The average length of the survey was 15 minutes. The questionnaire used is presented in Appendix XIV, while complete survey results are outlined in Appendix XV. Drawing a random sample of 100 participants from a population of 2,361 yields a margin of error of 8.1% at a 90% confidence level.

## Unitary Savings Review

The Evaluator did a complete review and update of unitary savings values and produced the 2024-2025 Demand-side Management Measure Assessment (DSM MA).<sup>31</sup> The unitary savings review entailed a literature review of technical reference manuals, metering studies, and program evaluations to determine if there are more appropriate<sup>32</sup> methodologies or parameters to be applied to calculate energy and peak demand unitary savings, including elements such as baseline assumptions, operating hours, efficiency levels, peak demand-to-energy ratios, and interactive effect factors.

## Site Visits

In September and October 2024, Equilibrium Engineering (a brand under the LMMW Group Ltd.) performed on-site visits in 60 participant homes. The site visits served mainly to establish installation rates, the results of which are discussed in Subsection 14.2.1. The protocol used for the on-site visits is presented in Appendix XVI.

## EUL Update

The Evaluator updated the EUL values of lighting products given the rapid evolution of the lighting market. The 2024-2025 DSM MA was updated accordingly.

## Calculations Using Evaluation Results

Building on all the above methods and collected data, the Evaluator calculated the first-year and lifetime electrical energy and peak demand savings as per the calculation methodology presented in Subsection 14.2 below.

## GHG Emission Reduction Calculations

To obtain net avoided GHG emissions in CO<sub>2</sub> eq for EPI, the Evaluator multiplied net energy savings by the latest Nova Scotia-specific factor for GHG emissions generated by electricity production. This factor was established using Nova Scotia Power (NSP) data.

---

<sup>31</sup> The 2024-2025 DSM MA is a reference document that provides an in-depth review of all parameters necessary to calculate the annual and lifetime gross electrical energy and peak demand savings of most prescriptive measures and some semi-prescriptive measures offered through E1's DSM program portfolio. In addition, the Measure Assessment includes effective useful life values for all measures offered in E1's program portfolio. For the remainder of the evaluations to be conducted during the 2023-2025 DSM cycle, the Evaluator will refer to the values presented in the 2024-2025 DSM MA.

<sup>32</sup> The Evaluator will judge whether new studies are more appropriate based on various factors, including but not limited to the following: The similarities between the measures implemented in the given study and E1's measures; and similarities in terms of climate or market conditions, the size of the sample studied, whether a study is recent, the quality of the study methodology, etc.

## Jurisdictional Scan

In the fall of 2024, the Evaluator performed a scan across 15 jurisdictions throughout Canada and the United States (US) to identify other measures that could be installed by electricians under EPI. The jurisdictional scan findings are presented in Appendix XIX and are discussed in Subsection 15.1 below.

### Note on Margins of Error

For evaluation activities that yield quantitative results based on a sample, the Evaluator aimed to achieve a maximum margin of error of 10% at a confidence level of 90%. This means that, if measurements were conducted many times with different samples, the data would be within 10 percentage points above or below the percentage reported 90% of the time. Thus, the margin of error indicates the relative level of precision<sup>33</sup> of a measurement, while its associated confidence level indicates the probability of a measurement falling within the margin of error.<sup>34</sup>

As part of the EPI evaluation, the Evaluator calculated the margins of error for installation rates, free-ridership levels, and spillover levels. The margins of error are listed alongside results in the applicable sections below. Examples of calculations used to establish margins of error are provided in Appendix II of the 2024 DSM Programs Evaluation Executive Summary.

---

<sup>33</sup> Precision refers to how reproducible a set of measurements is. It does not take into account how close the measured values are to the true values since this would refer to accuracy.

<sup>34</sup> As part of this evaluation, the confidence levels and margins of error only take random sampling errors into account; they do not reflect non-sampling errors or biases such as data entry errors, inaccurate responses from respondents, or the inability to contact certain people.

## 13 EPI Participant Perspectives

This section summarizes the findings obtained through the EPI participant survey.

A survey of 100 participating households was conducted as part of the 2024 EPI evaluation. Surveyed participants were asked questions regarding their awareness, motivations for participating, satisfaction and concerns about the services provided and their participation, and recommendations for program component improvements.

Almost half of participants first learned of EPI by word of mouth (22%), online advertisement (16%), or social media (9%). Participation in EPI was primarily motivated by a desire to save on energy costs (61%), although certain participants were concerned that they would not eventually save money (8%) when they initially thought about participating in EPI. A desire for energy efficient upgrades was the second most cited motivation for participation (26%) despite concerns expressed by a few participants that they would not save energy (8%). Overall, most participants (65%) reported having no concerns about participating in EPI.

Most participants (95%) were present when the energy efficient products were installed and most (88%) received information about energy efficient products during the installer visit. Five out of the 11 participants who did not receive this information expressed interest in it.

Satisfaction with EPI overall is very high with an average of 9.4 on a scale of 1 to 10, where 1 means “Not at all satisfied” and 10 means “Completely satisfied”. Participants were mainly satisfied with the installer (41%), the information received (25%), and the good service provided in general (19%).

As outlined in Figure 38 below, participants also provided high satisfaction ratings for each aspect of the program component. The level of satisfaction is notably high in regard to the installation time and the quality of the work performed.

**Figure 38: 2024 Participant Satisfaction with EPI (10-point Scale)**

Three-quarters of participants (75%) had no improvement recommendations for EPI, although a small proportion recommended offering more product options (12%), a better installation service (6%), more information on products or product guides (3%), and more recommendations (3%).

### 2024 EPI Participant Perspective Highlights

- › Participants learned about EPI mainly through word of mouth followed by online advertisements and social media.
- › Satisfaction with the service overall is very high as is satisfaction with specific aspects.
- › Most participants have no recommendations for how to improve EPI.

## 14 EPI Impact Evaluation

The objectives of the 2024 EPI impact evaluation were to determine gross and net electrical energy and peak demand savings.

### 14.1 Tracking Sheet Audit

To ensure program component results were reliably compiled, the Evaluator first performed a tracking sheet audit aimed at verifying the completeness and consistency of the data submitted by E1. The verification and corrective actions taken by the Evaluator, where applicable, are described in Appendix XIII. The tracked savings results presented in this report therefore refer to the corrected tracked savings obtained by the Evaluator.

### 14.2 Gross Savings

For EPI, gross savings correspond to the change in energy consumption resulting from installing energy efficient products in participant homes regardless of why they participated.<sup>35</sup> The Evaluator relied on information from the 2024-2025 DSM MA to calculate gross savings for EPI measures. The Evaluator also applied an adjustment ratio determined as part of the 2019 evaluation to correct observed discrepancies in tracked lamp replacements.

In addition, the Evaluator updated the EUL values of lighting products and referred to the 2024-2025 DSM MA for the EUL values of all other products.

#### 14.2.1 Installation Rates

Installation rates represent the proportions of products recorded in the tracking sheet that remain installed in participant homes. During the 2024 evaluation, the Evaluator conducted 60 on-site visits to update installation rates for measures in the main EPI offering. While the Evaluator selected projects with multiple measures to optimize the number of measures for which the Evaluator would be able to establish an installation rate with an acceptable margin of error, some less installed measures were only encountered in a few visited sites, which did not allow the Evaluator to obtain reliable installation rates for a few products. For those products, the Evaluator used the following assumptions:

- › Thermostatic shower valves: The Evaluator used the 2024 installation rate of 89% even though the margin of error was above 10% since the installation rate was very close to the value of 88% obtained in the previous round of site visits in 2021, thus increasing confidence in the accuracy of the selected installation rate.
- › Smart thermostats for MSHPs: The margin of error being only slightly above 10%, the Evaluator assumed that using that installation rate would result in a more accurate savings estimate than applying no installation rate. The 84% installation rate is mostly due to participants disconnecting their smart thermostats because of arising issues or dissatisfaction with the product. More precisely, one participant reported disconnecting due to issues and two due to dissatisfaction; for two others, the number of thermostats in the tracking sheet did not match what was observed on site.

---

<sup>35</sup> Definition adapted from: National Renewable Energy Laboratory, The Uniform Methods Project Chapter 23: Estimating Net Savings: Common Practices, September 2014, p.3.

- › Foam gaskets: The installations of foam gaskets could not be visually confirmed within the time allotted for site visits. Instead, the Evaluator verbally confirmed if participants received them and if they installed some or all of them. Among the visited participants that received foam gaskets based on the tracking sheet, 83% confirmed having received this product. The Evaluator assumed that seven foam gaskets (out of ten per package) were installed on average based on the number of observed plugs and switches on exterior walls during the visits. Participants had difficulties confirming if the foam gaskets were installed or how many were installed; therefore, the Evaluator also included an uncertainty factor of 50%. The equation below presents the calculation of the foam gasket installation rate.

*Foam Gasket Installation Rate*

$$= \% \text{ of Participants that Confirmed Receiving Foam Gaskets} \times \text{Uncertainty Factor} \\ \times \frac{\text{Average Number Installed}}{\text{Number per Package}} = 83\% \times 50\% \times 7/10 = 29\%$$

- › Door sweeps: Only one door sweep was included in the sample and it was confirmed to be installed. This is aligned with what had been observed in the previous round of site visits, so an installation rate of 100% was used.
- › Window air sealing: Since the margin of error obtained through 2024 site visits (27.8%) was well above 10%, the Evaluator elected to use the installation rate from the previous round of site visits in 2021, which had a margin of error of 11.6% considerably closer to 10%. In addition, the installation rates established in 2021 and 2024 were similar (84% in 2021 and 86% in 2024), thus increasing confidence in the accuracy of the selected installation rate.
- › Door weatherstripping: No door weatherstripping was included in the 2024 site visit sample. Like in 2021, door weatherstripping and window air sealing measures were combined since the decision-making processes of installing or removing those products were considered to be similar. Therefore, the installation rate of 84% used for window air sealing was also used for door weatherstripping.
- › Window film kits: Since window film kits are typically installed during winter, none was confirmed as installed during the site visits conducted in the fall 2024. The Evaluator therefore relied on a literature review that served to identify an installation rate of 57%.
- › For EPI measures introduced in 2024, namely smart thermostats for electric baseboards, advanced learning thermostats for electric heating, solar security fixtures, dimmer switches, indoor motion sensors, outdoor motion sensors, and humidity sensors, the Evaluator assumed an installation rate of 100% given the nature of the program component and because they are all electrician-installed measures.

Table 27 lists the installation rates that the Evaluator applied to gross savings.

**Table 27: EPI Product Installation Rates**

| Product                                                                | Installation Rate Applied to Gross Savings | Margin of Error | Reference                       |
|------------------------------------------------------------------------|--------------------------------------------|-----------------|---------------------------------|
| <b>Lighting Products</b>                                               |                                            |                 |                                 |
| LED Lamps                                                              | 94%                                        | 3.0%            | 2024 EPI on-site visits         |
| LED Nightlights                                                        | 94%                                        | 3.0%            | 2024 EPI on-site visits         |
| Dimmer Switches                                                        | 100%                                       | N/A             | Assumption                      |

## 14.2.2 Unitary Energy Savings

For EPI, E1 establishes separate unitary savings values for single-family homes and apartments. For the 2024 evaluation, the Evaluator used the unitary savings values from the 2024-2025 DSM MA. That document provides a detailed description of inputs, references, and unitary savings calculations for all product types offered through EPI. Since the MA was updated in 2024, the unitary energy savings values of multiple measures were updated. Table 28 summarizes the tracked and evaluated unitary energy savings for each product installed through EPI and for which the unitary energy savings were changed in 2024.

<sup>36</sup> Illinois Commerce Commission, *Illinois Statewide Technical Reference Manual for Energy Efficiency Version 12.0, Volume 3*, September 2023, p. 384.

**Table 28: 2024 EPI Updated Tracked and Evaluated Unitary Energy Savings**

| Product                                | EPI – Single-family Homes |                            | EPI – Apartments         |                            |
|----------------------------------------|---------------------------|----------------------------|--------------------------|----------------------------|
|                                        | Tracked Savings [kWh/yr]  | Evaluated Savings [kWh/yr] | Tracked Savings [kWh/yr] | Evaluated Savings [kWh/yr] |

| * Tracked unitary savings values for foam gaskets, window air sealing and door weather stripping were respectively per pack of 10, per 15 feet and per 17 feet, while evaluated unitary savings herein are per unit or per foot. This is only to reflect true unitary savings values and does not affect total savings claimed for these products. |                           |                            |                          |                            |

### 14.2.3 Unitary Peak Demand Savings

Peak demand savings correspond to the demand savings that coincide in time with the peak demand period of the electricity system. The projected electricity demand peak period in Nova Scotia is between 5 p.m. and 7 p.m. in the months of December to February on non-holiday weekdays.

The Evaluator established unitary peak demand savings for each product based on the peak demand-to-energy ratios presented in the 2024-2025 DSM MA. Differences between tracked and evaluated peak demand savings reflect updates made to the unitary energy savings of certain products.

Table 29 summarizes the tracked and evaluated unitary peak demand savings for each product installed through EPI and for which the unitary peak demand savings were changed in 2024.

**Table 29: 2024 EPI Updated Tracked and Evaluated Unitary Peak Demand Savings Values**

### 14.2.4 Interactive Effects

In a home, interactive effects occur when the implementation of energy efficiency products has an impact on the energy consumption of other elements such as heating and cooling. In the case of EPI, replacing lighting products with LEDs causes an increase in the heating load during winter and a decrease in the cooling load during summer. The same effects occur for hot water insulation products.

For the 2024 evaluation, the Evaluator relied on the interactive effects factors presented in the 2024-2025 DSM MA. For each entry in the EPI tracking sheet, energy and peak demand interactive effects factors were determined based on product type, location, and home type and were applied to the unitary energy and peak demand savings values.

### 14.2.5 Adjustment Ratio

As part of the 2019 evaluation, the Evaluator conducted on-site visits (n = 28) to establish an overview of the types of lamps used in homes and verify that replaced A-type lamps were properly tracked. The on-site visit results indicated that there were certain discrepancies in tracked savings.

Comparing the revised savings to tracked savings, the Evaluator determined an adjustment ratio of 96% with a margin of error of 5%. In an effort to track the wattages of replaced A-type lamps more accurately, E1 introduced new product categories to include a larger range of wattages. In 2024, 1,010 LED lamps were tracked under those new categories, which represent about 1% of LED A-type lamps installed under EPI.

No data collection aimed at updating the adjustment ratio was conducted in 2024. Therefore, given the low number of LED lamps tracked under the new categories, as was the case in the 2019 evaluation, this adjustment ratio was applied to the tracked savings for A-type incandescent lamp replacements to correct for observed discrepancies in tracked replaced lamps.

### 14.2.6 Effective Useful Life

As part of the 2024-2025 DSM MA activities, the Evaluator reviewed the EUL values used in the calculation of electrical energy savings that are expected to persist over time. Apart from lighting products, the EUL values established in the 2023 evaluation remained valid for the 2024 evaluation. For lighting products, EUL values were updated since baseline changes are anticipated during the measure lifetimes due to the rapid evolution of the LED market driven in part by government regulations. Appendix II of the 2024-2025 DSM MA details the baseline changes and the rationale for the calculation of equivalent EUL values.

Table 30 below summarizes the tracked and revised equivalent EUL values. The revised equivalent EUL values are applied to each product gross and net first-year electrical energy savings to obtain gross and net lifetime electrical energy savings. As a result, the weighted average EUL values of gross and net savings differ (see Subsections 14.2.7 and 14.3.4 below). Table 30 also presents the evaluated gross lifetime unitary savings. The measures in Table 30 are only those for which the equivalent EUL values were changed in 2024.

**Table 30: 2024 EPI Equivalent EUL and Gross Lifetime Unitary Savings Values**

| Product              | Tracked<br>Equivalent EUL<br>[years] | Evaluated<br>Equivalent EUL<br>[years] | Evaluated Gross Lifetime<br>Unitary Savings [kWh] |

### 14.2.7 Evaluated Gross Savings

Table 31 and Table 32 below present the annual gross savings results per product category and dwelling for the main EPI offering, including the smart thermostat for electric baseboard pilot measure. Table 33 further below presents the breakdown of savings results for apartments, single-family homes, and EPI as a whole.

Overall, total gross energy and peak demand savings amounted to 9.093 GWh and 0.898 MW at the generator respectively, which represent 52.872 GWh in lifetime electrical energy savings. As a result, the weighted average EUL value for gross electrical energy savings was established at 5.8 years.

The gross savings at the generator were estimated using the appropriate line loss factors for each participant based on their rate code. The line loss factors correspond to the values submitted to the Nova Scotia Utility and Review Board (NSUARB) as part of the 2014 Cost of Service Study Progress Update.<sup>38</sup>

---

<sup>38</sup> Nova Scotia Utility and Review Board, Matter M06555, 2014 Cost of Service Study Progress Update, Exhibit N-2.09, Appendix I1. For municipal utility participants, the line loss factor of the most similar NS Power rate code was assumed. If a municipal utility participant did not have a specific rate code, the average of participants for which the line loss was known was used.

| * The interactive effects and line loss factors correspond to the average for each product weighted according to the proportion of each type of home and rate code. The interactive effects factor is obtained by dividing gross savings at the meter by the unitary savings value, installation rate, number of units, and adjustment ratio when applicable. The line loss factor is obtained by dividing gross savings at the generator by gross savings at the meter. |               |        |        |        |        |        |        |        |

| * The interactive effects and line loss factors correspond to the average for each product weighted according to the proportion of each type of home and rate code. The interactive effects factor is obtained by dividing gross savings at the meter by the unitary savings value, installation rate, number of units, and adjustment ratio when applicable. The line loss factor is obtained by dividing gross savings at the generator by gross savings at the meter. |                      |                          |                           |                            |                            |

| * The interactive effects and line loss factors correspond to the average for each product weighted according to the proportion of each type of home and rate code. The interactive effects factor is obtained by dividing gross savings at the meter by the unitary savings value, installation rate, number of units, and adjustment ratio when applicable. The line loss factor is obtained by dividing gross savings at the generator by gross savings at the meter. |             |                            |                            |                             |                                         |

| * The interactive effects and line loss factors correspond to the average for each product weighted according to the proportion of each type of home and rate code. The interactive effects factor is obtained by dividing gross savings at the meter by the unitary savings value, installation rate, number of units, and adjustment ratio when applicable. The line loss factor is obtained by dividing gross savings at the generator by gross savings at the meter. |                 |                                    |                      |                    |                   |

| * The interactive effects and line loss factors correspond to the average for each product weighted according to the proportion of each type of home and rate code. The interactive effects factor is obtained by dividing gross savings at the meter by the unitary savings value, installation rate, number of units, and adjustment ratio when applicable. The line loss factor is obtained by dividing gross savings at the generator by gross savings at the meter. |                                  |                         |                                                    |                                   |                                                                                               |                                                                                            |

| * The interactive effects and line loss factors correspond to the average for each product weighted according to the proportion of each type of home and rate code. The interactive effects factor is obtained by dividing gross savings at the meter by the unitary savings value, installation rate, number of units, and adjustment ratio when applicable. The line loss factor is obtained by dividing gross savings at the generator by gross savings at the meter. |                                             |                       |                        |                 |                  |                         |

| * The interactive effects and line loss factors correspond to the average for each product weighted according to the proportion of each type of home and rate code. The interactive effects factor is obtained by dividing gross savings at the meter by the unitary savings value, installation rate, number of units, and adjustment ratio when applicable. The line loss factor is obtained by dividing gross savings at the generator by gross savings at the meter. |                                                    |              |                                      |                     |                                          |

| * The interactive effects and line loss factors correspond to the average for each product weighted according to the proportion of each type of home and rate code. The interactive effects factor is obtained by dividing gross savings at the meter by the unitary savings value, installation rate, number of units, and adjustment ratio when applicable. The line loss factor is obtained by dividing gross savings at the generator by gross savings at the meter. |                                          |             |                               |                  |                                    |                               |

| * The interactive effects and line loss factors correspond to the average for each product weighted according to the proportion of each type of home and rate code. The interactive effects factor is obtained by dividing gross savings at the meter by the unitary savings value, installation rate, number of units, and adjustment ratio when applicable. The line loss factor is obtained by dividing gross savings at the generator by gross savings at the meter. |               |        |        |        |        |        |        |       |

| * The interactive effects and line loss factors correspond to the average for each product weighted according to the proportion of each type of home and rate code. The interactive effects factor is obtained by dividing gross savings at the meter by the unitary savings value, installation rate, number of units, and adjustment ratio when applicable. The line loss factor is obtained by dividing gross savings at the generator by gross savings at the meter. |                      |                          |                           |                            |                            |

| * The interactive effects and line loss factors correspond to the average for each product weighted according to the proportion of each type of home and rate code. The interactive effects factor is obtained by dividing gross savings at the meter by the unitary savings value, installation rate, number of units, and adjustment ratio when applicable. The line loss factor is obtained by dividing gross savings at the generator by gross savings at the meter. |             |                            |                            |                             |                                      |

| * The interactive effects and line loss factors correspond to the average for each product weighted according to the proportion of each type of home and rate code. The interactive effects factor is obtained by dividing gross savings at the meter by the unitary savings value, installation rate, number of units, and adjustment ratio when applicable. The line loss factor is obtained by dividing gross savings at the generator by gross savings at the meter. |                 |                                    |                      |                    |                   |

## Evaluated 2024 EPI Gross Electrical Energy and Peak Demand Savings per Measure – Apartments (Continued)

| Product Category                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Pipe Insulation (per foot) | Hot Water Tank Wraps | Smart Thermostats for Electric Baseboards | Smart Thermostats for MSHPs | Advanced Learning Thermostats for Central Electric Heating Without a Heat Pump | Advanced Learning Thermostats for Central Electric Heating with a Heat Pump |

| * The interactive effects and line loss factors correspond to the average for each product weighted according to the proportion of each type of home and rate code. The interactive effects factor is obtained by dividing gross savings at the meter by the unitary savings value, installation rate, number of units, and adjustment ratio when applicable. The line loss factor is obtained by dividing gross savings at the generator by gross savings at the meter. |                            |                      |                                           |                             |                                                                                |                                                                             |

\* The interactive effects and line loss factors correspond to the average for each product weighted according to the proportion of each type of home and rate code. The interactive effects factor is obtained by dividing gross savings at the meter by the unitary savings value, installation rate, number of units, and adjustment ratio when applicable. The line loss factor is obtained by dividing gross savings at the generator by gross savings at the meter.

| * The interactive effects and line loss factors correspond to the average for each product weighted according to the proportion of each type of home and rate code. The interactive effects factor is obtained by dividing gross savings at the meter by the unitary savings value, installation rate, number of units, and adjustment ratio when applicable. The line loss factor is obtained by dividing gross savings at the generator by gross savings at the meter. |                                          |                |                                      |                     |                                          |                      |

Table 33 combines total EPI results for single-family homes and apartments.

| * The installation rates, EUL values, and line loss factors correspond to the average for each offering weighted according to the proportion of each type of product and rate code. The installation rate is obtained by dividing the installed number of units by the total number of units. The EUL value is obtained by dividing lifetime gross energy savings at the generator by gross energy savings at the generator. The line loss factor is obtained by dividing gross savings at the generator by gross savings at the meter. |                               |                      |             |

Figure 39 below compares the tracked and evaluated gross electrical energy savings at the generator, while Figure 40 further below compares the tracked and evaluated gross peak demand savings at the generator. For the most part, tracked and evaluated savings are similar, with differences being due to updates to the savings parameters in the 2024-2025 DSM MA.

**Figure 39: 2024 EPI Tracked and Evaluated Gross Electrical Energy Savings at the Generator**

**Figure 40: 2024 EPI Tracked and Evaluated Gross Peak Demand Savings at the Generator**

GHG emission reductions were calculated by applying the Nova Scotia-specific factor<sup>39</sup> for GHG emissions generated by electricity production to EPI gross savings results, the results of which are presented in Table 34.

**Table 34: Evaluated 2024 EPI Gross GHG Emission Reductions**

|                                                                                             | Total        |
|---------------------------------------------------------------------------------------------|--------------|
| <b>Gross Energy Savings – at the Generator (GWh)</b>                                        | <b>9.093</b> |
| Nova Scotia-specific GHG Emissions Factor for Electricity Production (tonnes of CO2 eq/GWh) | 472.2        |
| <b>Gross Annual GHG Emission Reductions (tonnes of CO2 eq)</b>                              | <b>4,294</b> |

<sup>39</sup> At the time of writing, 2024 data were not yet available. The Nova Scotia-specific factor was obtained from Nova Scotia Power's 2023 total system emissions data (4,931,152 CO2 eq tonnes), and total electricity generation (10,442 GWh) was drawn from the following two sources: Nova Scotia Power, Total System Emissions, <https://www.nspower.ca/clean-energy/air-emissions-reporting> (last accessed September 27, 2024) and Emera Inc., Emera Inc. 2023 Annual Report, p. 31, available at [https://s25.q4cdn.com/978989322/files/doc\\_financials/2023/ar/Emera\\_2023\\_AR\\_FINAL.pdf](https://s25.q4cdn.com/978989322/files/doc_financials/2023/ar/Emera_2023_AR_FINAL.pdf) (last accessed September 27, 2024).

## 14.3 Net Savings

The Evaluator determined the net energy and peak demand savings, i.e. the electrical energy and peak demand savings that can be reliably attributed to a program component, by estimating the NTGR. In the case of EPI, the NTGR is established considering the free-ridership and participant spillover effects that positively or negatively affect energy savings.

### 14.3.1 Free-ridership

For EPI, free-ridership occurs when participants would have installed the same energy efficient products in the absence of the program component. For low-income participants, the free-ridership level is assumed to be nil, while free-ridership for non-low-income participants was assessed during the 2024 evaluation using a self-report approach that involved asking a set of questions during a telephone survey to 100 non-low-income participants that received at least LED lamps, one smart thermostat, or any domestic hot water (DHW) measure.

To comply with the best practices highlighted in the Net-to-Gross Ratio Review<sup>40</sup> report by not assuming nil free-ridership for measures without measured free-ridership, the Evaluator relied on a literature review to select free-ridership levels to be used for air sealing products and smart power controllers. For measures added to EPI in 2024, the Evaluator assigned already established free-ridership levels for similar products, except for humidity sensors for which the Evaluator provides a rationale for the free-ridership level.

For air sealing products, free-ridership values were found in three jurisdictions<sup>41</sup> and ranged from 9% to 28%, although most programs were not fully comparable with EPI. Indeed, while EPI is a direct install program, air sealing products are mostly left behind by installers, which is not a delivery model that was found in other jurisdictions with available free-ridership levels. The Evaluator considers it more likely that more participants that had the products installed through a program would not have installed them if there was no program compared to those that had to install them themselves since they were left behind. Consequently, the Evaluator elected to use a free-ridership value closer to the lower range of those found in the literature and selected a free-ridership level of 12% from the Massachusetts 2022 Technical Reference Manual.

For smart power controllers such as those installed through EPI, only one jurisdiction was found to have a free-ridership level for this product through a direct install program; the Evaluator therefore used the level of 3% from the Westario Power Residential Direct Install 2016 evaluation.<sup>42</sup>

For measures added to EPI in 2024, free-ridership levels were not evaluated through the 2024 on-site visits because participants with these measures were not integrated into the tracking sheet at the time of sampling. The Evaluator therefore determined free-ridership levels for these measures based on similarities with measure categories for which free-ridership levels were already established. For dimmer switches, indoor motion sensors, outdoor motion sensors, and solar security fixtures, the Evaluator used the free-ridership level for LED lighting since these products are also lighting products. For advanced learning thermostats, the Evaluator used the smart thermostat free-ridership level given the similarity between both product types.

Finally, for humidity sensors, which do not share similarities with other EPI products with an established free-ridership level, the Evaluator assumed a free-ridership level of 0% due to the rarity of the product and complexity of the installation.

Table 35 below outlines the free-ridership levels resulting from the 2024 evaluation.

**Table 35: 2024 EPI Participant Free-ridership Levels**

|                                            | Average Free-ridership Level | Margin of Error |
|--------------------------------------------|------------------------------|-----------------|
| <b>Low-income Participants</b>             |                              |                 |
| All Products                               | 0%                           | N/A             |
| <b>Non-low-income Participants</b>         |                              |                 |
| LED Lighting and Lighting Related Products | 16%                          | 3.2%            |
| Smart and Advanced Learning Thermostats    | 9%                           | 2.9%            |
| DHW Products                               | 11%                          | 5.2%            |
| Air Sealing Products                       | 12%                          | N/A             |
| Smart Power Controllers                    | 3%                           | N/A             |
| Humidity Sensors                           | 0%                           | N/A             |

In comparison, the free-ridership level for LED lighting was 25% when it was last evaluated in 2021. Therefore, the 2024 free-ridership level of 16% represents a reduction of 9% compared to the 2021 evaluation results. This reduction is largely explained by the update made to the free-ridership algorithm, notably increasing the weight of influence since EPI and E1 influence was high, which translates into low free-ridership.

For other measures, the 2021 evaluation served to assess only low-flow showerhead free-ridership, which was established at 10%, while the 2024 evaluation encompassed all DHW measures and resulted in a free-ridership level of 11%. With the different measures included in the analysis and the changes to the algorithm, the 2021 and 2024 free-ridership levels should not be directly compared.

The smart thermostat free-ridership level was not assessed in 2021 since that measure had not yet been included in EPI.

### 14.3.2 Participant Spillover

For EPI, participant spillover occurs when participants purchase and install additional energy efficient products due to the influence of having participated in the program component without receiving any additional support from an E1 program. Similarly to free-ridership, spillover was assessed during the 2024 evaluation using a self-report approach that involved asking a set of questions during a telephone survey to 100 non-low-income participants that received at least LED lamps, one smart thermostat, or any DHW measure.

Among the 100 surveyed participants, 17 installed efficient products available or promoted through EPI after their participation in the program component and for which EPI had an influence in their decision to install the given product. The products that most generated spillover were LED lamps and fixtures as well as heat pump water heaters. A few participants also installed a new efficient appliance, a smart power bar, or faucet aerators.

Table 36 outlines the participant spillover levels established through the 2024 evaluation.

**Table 36: 2024 EPI Participant Spillover Levels**

| Average Participant Spillover Level |    | Margin of Error |
|-------------------------------------|----|-----------------|
| <b>Low-income Participants</b>      |    |                 |
| All Products                        | 0% | N/A             |
| <b>Non-low-income Participants</b>  |    |                 |
| All Products                        | 8% | 3.8%            |

In comparison, the 8% spillover level established for 2024 was similar to the 10% established through the last evaluation in 2021.

### 14.3.3 Net-to-gross Ratio Calculation

The NTGR values were calculated using the following equation.

$$NTGR = (1 - \% \text{ Free-ridership} + \% \text{ Internal Spillover})$$

Overall NTGR values were calculated using the free-ridership and spillover levels established per participant type and product category and the proportions of savings associated with each participant type in each product category.

Table 37 outlines the overall NTGR values established through the 2024 evaluation.

**Table 37: 2024 EPI Net-to-gross Ratios by Product Category**

| Products                                       | Participant Type            | NTGR | Proportion of Product Category Gross Savings by Participant Type | Overall NTGR Values |
|------------------------------------------------|-----------------------------|------|------------------------------------------------------------------|---------------------|
| <b>LED Lamps and Lighting Related Products</b> | Non-low-income Participants | 0.92 | 32%                                                              | <b>0.97</b>         |
|                                                | Low-income Participants     | 1.00 | 68%                                                              |                     |
| <b>Smart and Advanced Learning Thermostats</b> | Non-low-income Participants | 0.99 | 49%                                                              | <b>1.00</b>         |
|                                                | Low-income Participants     | 1.00 | 51%                                                              |                     |
| <b>DHW Products</b>                            | Non-low-income Participants | 0.97 | 35%                                                              | <b>0.99</b>         |
|                                                | Low-income Participants     | 1.00 | 65%                                                              |                     |
| <b>Air Sealing Products</b>                    | Non-low-income Participants | 0.96 | 41%                                                              | <b>0.98</b>         |
|                                                | Low-income Participants     | 1.00 | 59%                                                              |                     |
| <b>Smart Power Controllers</b>                 | Non-low-income Participants | 1.05 | 38%                                                              | <b>1.02</b>         |
|                                                | Low-income Participants     | 1.00 | 62%                                                              |                     |
| <b>Humidity Sensors</b>                        | Non-low-income Participants | 1.08 | 51%                                                              | <b>1.04</b>         |
|                                                | Low-income Participants     | 1.00 | 49%                                                              |                     |

### 14.3.4 Evaluated Net Savings

Net savings are defined as the energy use reductions that are specifically attributable to EPI. Net savings were estimated by applying the overall NTGR to gross savings as exemplified in the following equation.

$$\text{Net Savings} = \text{Gross Savings} \times \text{NTGR}$$

This equation was used to calculate both electrical energy savings and peak demand savings.

The detailed results per measure are presented in Table 38 below. The net energy savings resulted in 4,225 tonnes of CO2 eq in net annual GHG emission reductions.

**Table 38: Evaluated 2024 EPI Net Electrical Energy and Peak Demand Savings per Measure**

| Product Category                                                                                                                                                                                                            | LED Lamps     |              |              |              |              |              |              |              |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|--------------|--------------|--------------|--------------|--------------|--------------|--------------|
|                                                                                                                                                                                                                             | 9 W Replacing |              |              |              |              |              |              |              |
|                                                                                                                                                                                                                             | 25 W          | 29 W         | 40 W         | 43 W         | 60 W         | 72 W         | 100 W        | 150 W        |

| * The line loss factors correspond to the average for each product weighted according to the proportion of each rate code. These factors are obtained by dividing net savings at the generator by net savings at the meter. |               |              |              |              |              |              |              |              |

| * The line loss factors correspond to the average for each product weighted according to the proportion of each rate code. These factors are obtained by dividing net savings at the generator by net savings at the meter. |                 |                                    |                      |                    |                   |

| * The line loss factors correspond to the average for each product weighted according to the proportion of each rate code. These factors are obtained by dividing net savings at the generator by net savings at the meter. |                 |                      |                                           |                             |                                                                                |                                                                             |

| * The line loss factors correspond to the average for each product weighted according to the proportion of each rate code. These factors are obtained by dividing net savings at the generator by net savings at the meter. |                                             |                       |                        |                 |                  |                         |

As outlined in Figure 41, EPI fell short of its electrical energy and peak demand savings targets by 15% and 22% respectively.

**Figure 41: 2024 EPI Targets and Net Evaluated Savings**

## 14.4 Realization Rate

Table 39 below compares the energy and peak demand savings established through the 2024 evaluation to those tracked in the 2024 tracking sheet. It also includes the realization rate, representing the ratio of evaluated net savings to tracked net savings, for both energy savings and peak demand savings.

**Table 39: Comparison of 2024 EPI Tracked and Evaluated Savings at the Generator**

|                                                                                                                                                                  | Gross Savings |      | NTGR* | Net Savings |      | Realization Rate Value |

| Tracked Savings by E1                                                                                                                                            | 0.879         | MW   | 0.99  | 0.872       | MW   | 101%                   |
| Evaluation Results                                                                                                                                               | 0.898         | MW   | 0.98  | 0.880       | MW   |                        |
| *NTGRs varied for each product category. The NTGRs presented in this table correspond to the rounded averages obtained by dividing net savings by gross savings. |               |      |       |             |      |                        |

Tracked gross energy and peak demand savings were 6% lower and 1% higher than the tracked savings respectively. These differences were due to the update to the 2024-2025 DSM MA. LED lamps, which generated approximately 43% of EPI energy savings in 2024, had their hours of use reduced from 2.7 to 2.6, which reduced unitary savings values by around 4%. Moreover, the introduction of the 84% installation rate for smart thermostats for MSHPs, which was 100% before the update, also explains why evaluated electrical energy savings were lower than tracked electrical energy savings. Even so, smart thermostats for MSHPs had no peak demand savings so this downward impact did not carry over to peak demand savings. Finally, the overall NTGR values established for 2024 were slightly lower than the values used for 2023, which was due to the decreased NTGR value for smart thermostats for MSHPs being counter-balanced by the increased NTGR value for LED lamps.

## 15 EPI Market Evaluation

### 15.1 Jurisdictional Scan

This section outlines the findings of the jurisdictional scan conducted to identify opportunities for electrician-installed measures.

In 2023, E1 introduced some electrician-installed measures to the EPI offering and additional electrician-installed measures were added in 2024; those measures include smart thermostats, lighting controls, and humidity sensors. Therefore, the Evaluator performed a scan across various jurisdictions throughout Canada and the United States (US) to identify other measures that could be installed by electricians under EPI. The Evaluator first focused on direct install programs and then extended the scan to instant rebate programs since potential electrician-installed measures might be found in such programs. For direct install programs, five Canadian and four US jurisdictions were reviewed, for a total of nine reviewed jurisdictions. For instant rebate programs, five jurisdictions were reviewed in each country, for a total of 10.

For direct install programs, most jurisdictions include some measures beyond lighting, airtightness, and hot water products. However, most such additional measures were either already included in the new EPI electrician-installed measures (e.g. smart thermostats) or outside the scope of electrician-installed measures (e.g. insulation, appliances, window air conditioning, heat pumps, heat recovery ventilation, as well as attic or whole-house fans). Similarly, almost all products included through instant rebate programs were either already included in EPI or outside the category of electrician-installed measures (e.g. appliances).

Globally, the scan revealed only a few measures to be considered for the EPI electrician-installed offer as follows:

- › **Advanced heat recovery ventilator (HRV) controls** are typically used in intermittent mode, such as 20 minutes ON and 40 minutes OFF, which corresponds to 67% fewer runtime hours and, consequently, 67% less consumed energy. Such controls can be installed by an electrician if they have access to the HRV and if that HRV only has timer or manual controls.
- › **Bathroom fans** that could be replaced by more recent and efficient models represent an opportunity, although installing a bathroom fan where there was none would increase energy consumption and therefore be seen more as a health and safety measure. If used three hours per day every day, an efficient bathroom fan can save approximately 4.4 kWh per year and up to 35.4 kWh per year if used continuously.<sup>43</sup>
- › **Block heater timers** are currently included through the E1 Instant Savings offering, yet EPI participants that have a block heater and no timer represent a good opportunity to add a timer to save energy. In the 2024-2025 DSM MA, this product has a unitary savings value of 122 kWh/year.
- › **Heat reflector panels or rolls** are thin reflective materials installed behind radiators to reduce heat loss by reflecting heat back into the room instead of allowing it to escape through external walls. This product is mostly useful in hydronically (hot water) heated homes, which are mostly non-electrically heated homes. Approximately 143 m<sup>3</sup> of natural gas per year are expected to be saved with this product.<sup>44</sup>

Other potential measures include smart connected outlets and switches, yet more studies are required to assess the energy and peak demand savings potential of these products since there is high uncertainty around their potential due to the behaviour aspect of how they can generate savings. Some potential also resides with heating and cooling system tune-ups, although EPI electricians would need to be certified refrigeration and air-conditioning mechanics to deliver such a service. Since such certification was not currently required for EPI electrician installers, the Evaluator did not include air-conditioning and heat pump tune-ups in the list above.

<sup>44</sup> Energy and Resource Solutions for the Ontario Energy Board. *Ontario Natural Gas TRM (version 7.0)*, November 2022.

Furthermore, EPI represents a good opportunity to educate participants on energy efficiency and inform them on their opportunities with other E1 programs. Therefore, EPI installers could identify energy-saving opportunities for products that cannot be replaced through an EPI visit, such as old or inefficient appliances, and offer rebates for replacing them if they are not part of another program.

Finally, some jurisdictions include measures targeted at health and safety, such as carbon monoxide detectors and dehumidifiers; however, these measures do not generate energy savings.

Appendix XIX includes a table presenting the scanned jurisdictions and the measures they offer.

| 2024 EPI Jurisdictional Scan Highlights |                                                                                                                                                                                                                                  |
|-----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ›                                       | The EPI offering includes most measures found in direct install programs that have some potential for the EPI electrician-installed offer.                                                                                       |
| ›                                       | Advanced heat recovery ventilator controls, bathroom fans, block heater timers, and heat reflector panels were the only additional measures identified as potentially suitable additions to the EPI electrician-installed offer. |
| ›                                       | Smart connected devices might represent good opportunities in the near future when the potential energy savings will be better supported by relevant studies.                                                                    |
| ›                                       | Heating and cooling system tune-ups could be a good opportunity, although installers would need certification.                                                                                                                   |

## 16 EPI Key Findings and Recommendations

As mentioned previously, the main objectives of the 2024 EPI evaluation were as follows:

- › Collect information on participant perspectives
- › Calculate gross and net EPI results, namely electrical first-year and lifetime energy savings, peak demand savings, as well as avoided GHG emissions<sup>45</sup>
- › Analyze market opportunities

This section provides the Evaluator's key findings and recommendations in relation to the above objectives.

### **2024 EPI-Finding: Participants are highly satisfied with the overall program component.**

During the 2024 participant survey, participants rated the overall program component a 9.4 out of 10 and also provided high ratings on the time taken to complete the work, the quality of work, the information received on energy efficient products, and the efficient products installed.

### **2024 EPI-Finding: EPI net electrical energy savings and peak demand savings fell short of targets.**

EPI achieved 8.948 GWh in net electrical energy savings and 0.880 MW in net peak demand savings at the generator in 2024, thus falling short of the planned net electrical energy savings of 10.569 GWh and net peak demand savings of 1.127 MW.

### **2024 EPI-Finding: Participation slightly increased in 2024, although not enough to increase savings compared to 2023.**

While participation increased by 2% in 2024, average electrical energy savings per participant decreased by 6.3%. This reduction in savings per participant was mainly due to the update to the 2024-2025 DSM MA, notably downward adjustments to smart thermostat and LED lamp unitary savings that respectively represented around 28% and 39% of EPI gross electrical energy savings in 2024.

### **2024 EPI-Finding: Installation rates for most products remained relatively stable, while those of smart thermostats for MSHPs were reduced.**

For the most part, installation rates measured during the 2024 on-site visits varied by less than 10% compared to installation rates used in 2023. One notable exception was smart thermostats for MSHPs, for which the Evaluator had assumed a 100% installation rate when the product was first introduced to EPI. An 84% installation rate was established for this product during the 2024 on-site visits, which represents a 16% reduction. This reduction is mainly due to participants disconnecting their smart thermostats because of arising issues or dissatisfaction with the product.

### **Recommendation #1: To improve the smart thermostat installation rate, explore and implement strategies to reduce the number of participants disconnecting this product due to dissatisfaction.**

For example, follow-up calls could be conducted, installers could educate more participants on this product, or additional educational material on this product could be shared with participants.

---

<sup>45</sup> First-year savings are based on typical energy consumption and do not consider changes in energy consumption resulting from the COVID-19 pandemic.

**2024 EPI-Finding: The overall NTGR for EPI value remained stable although per-product NTGR values varied more significantly.**

An overall NTGR of 0.98 was established for EPI in 2024 for both the evaluated electrical energy and peak demand savings, which was similar to 2023 overall NTGR values. The overall NTGR value was stable despite variations in per-product NTGR values. Indeed, it remained stable since the NTGR value for LED lighting increased by a similar factor to the one that the NTGR value for smart thermostats for MSHPs decreased by, thereby cancelling each other out.

**2024 EPI-Finding: Evaluated net electrical energy and peak demand savings were respectively lower and slightly higher than the values tracked by E1.**

The evaluated net electrical energy savings were 6% lower than the tracked net electrical energy savings, while the evaluated net peak demand savings were 1% higher than the tracked net peak demand savings. The main reason for this difference is the impact of the new installation rate of 84% for smart thermostats for MSHPs compared to the tracked value of 100% since this product was the second largest contributor to EPI energy savings in 2024. In addition, the hours of use value for LED lamps, the largest contributor to EPI energy savings in 2024, was reduced by 4%, consequently reducing the energy savings by the same amount. Since smart thermostats for MSHPs do not generate peak demand savings, the impact of the reduced installation rate did not carry over to evaluated net peak demand savings. Finally, the overall NTGR value established in 2024 was slightly lower than the values used in 2023.

**2024 EPI-Finding: The jurisdictional scan revealed several appropriate products to be considered for the EPI electrician-installed measure offer.**

The 2024 EPI jurisdictional scan allowed the Evaluator to identify several measures that would be appropriate for the electrician-installed measures offered through EPI, namely advanced heat recovery ventilator controls, bathroom fans, block heater timers, and heat reflector panels or rolls.

# 17 Green Heat Overview

This section describes Green Heat, follows up on past evaluation recommendations, and provides an overview of participation history.

## 17.1 Green Heat Description

The Green Heat component of the Existing Residential program is aimed at encouraging the installation of energy efficient heating systems as well as heating systems for which fuel is provided from renewable resources in Nova Scotia homes. More specifically, Green Heat provides financial incentives to homeowners for high-efficiency heat pumps, biomass heating systems, solar space and water heating systems, and demand reduction measures.

E1 staff manages and administers Green Heat. Figure 42 outlines the main steps of the Green Heat participation process.

Figure 42: Green Heat Participation Process Summary

Table 40 below summarizes current Green Heat incentives for each type of eligible system. In February 2024, incentives were increased for ductless mini-split heat pumps (MSHPs), centrally ducted air-source heat pumps (CASHPs), and air-to-water heat pumps (AWHPs). In March 2024, the pilot program delivering rebates for three-element water heaters was discontinued.

**Table 40: 2024 Green Heat Incentives**

| Measure                                                                                                                       | Incentive                   |
|-------------------------------------------------------------------------------------------------------------------------------|-----------------------------|
| <b>Heat Pumps</b>                                                                                                             |                             |
| Ductless Mini-split Heat Pumps                                                                                                | \$300/refrigeration tonne   |
| Centrally Ducted Air-source Heat Pumps                                                                                        | \$500/refrigeration tonne   |
| Air-to-water Heat Pumps                                                                                                       | \$2,000/refrigeration tonne |
| Ground-source Heat Pumps                                                                                                      | \$500/refrigeration tonne   |
| <b>Biomass</b>                                                                                                                |                             |
| Wood/Pellet Stoves or Fireplace Inserts                                                                                       | \$750/unit                  |
| Wood/Pellet Boilers or Centrally Ducted Forced Air Furnaces                                                                   | \$1,000/unit                |
| <b>Solar Thermal</b>                                                                                                          |                             |
| Solar Thermal: Air Heating                                                                                                    | \$400/unit                  |
| Solar Domestic Hot Water (DHW)                                                                                                | \$1,000/unit                |
| <b>Demand Reduction</b>                                                                                                       |                             |
| Electric Thermal Storage (ETS, listed room unit)                                                                              | \$316-\$1,600/unit*         |
| Electric Thermal Storage (unlisted room unit)                                                                                 | \$40/kWh                    |
| Electric Thermal Storage (central system)                                                                                     | \$2,000/unit                |
| Three-element Water Heaters (replacing electrical DHW)                                                                        | \$400/unit**                |
| Three-element Water Heaters (replacing oil-fired DHW)                                                                         | \$650/unit**                |
| DHW Heater Timers                                                                                                             | \$20/unit                   |
| * There were nine eligible ETS room units offered through Green Heat. The incentive level varied depending on the model.      |                             |
| ** Only eligible for installations before March 31, 2024. Applications had to be completed and submitted before May 31, 2024. |                             |

Since July 2018, through the addition of funds from the federal Low Carbon Economy Fund (LCEF) and provincial Green Fund, Green Heat has offered heating system rebates for non-electrically heated homes. The rebate amounts and criteria remain unchanged whether the home is electrically or non-electrically heated except for demand reduction measures. This report presents the evaluation results for measures generating electrical savings only. The savings associated with measures that displace non-electrical energy consumption are reported in the Government-funded Evaluation report and are therefore not included herein.

Green Heat was aimed at achieving net electrical energy savings of 3.600 GWh and net peak demand savings of 2.775 MW at the generator in 2024.

## 17.2 Follow-up on Past Evaluation Report Recommendations

The Evaluator evaluated Green Heat in previous years and issued improvement recommendations. Table 41 below provides a summary of the implementation status of past recommendations that were carried forward.

**Table 41: Implementation Status of Past Recommendations for Green Heat**

| #          | Past Recommendations                                                                                                                                                                             | Status      | Comments                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2023-GH-R1 | It would be in E1's best interest to ensure that Green Heat marketing materials are available to contractors and participants.                                                                   | In progress | In 2024, E1 worked to create new relevant marketing material. E1 also hosted a webinar in June 2024 for Efficiency Preferred Partners (EPP) to provide information on the differences in rebates for the Oil to Heat Pump Affordability program when participating in the Green Heat, HomeWarming, and Home Energy Assessment program components.                                                                                                                          |
| 2023-GH-R2 | Ensure that the Green Heat page is as user-friendly as possible by making sections, links, eligibility criteria, and eligible equipment lists clear, simple to understand, and easy to navigate. | Complete    | In 2024, E1 redesigned its website, including updates for the Green Heat page, which was completed in the fall of 2024.                                                                                                                                                                                                                                                                                                                                                    |
| 2023-GH-R3 | Investigate how communications between E1 and contractors and participants could be improved.                                                                                                    | Complete    | In 2024, E1 program staff implemented a one business day turn around for responses to contractors and participants emails to ensure timely communications. E1 Customer Services also added a queue callback option into the phone system as well as a webchat option in early 2024. To ensure ESA's have direct access to the most recent customer or participant information, Customer Services integrated their phone system with E1s Customer Information System (CIS). |
| 2023-GH-R4 | Consider offering increased incentives to low and moderate-income households and incentivizing heat pump replacements for those households.                                                      | In progress | E1's exploration of providing low and moderate-income rebates through Green Heat (in addition to market rebates) served to identify challenges with balancing administrative burden and providing a simple post-purchase offer to customers.                                                                                                                                                                                                                               |

## 17.3 Participation History

In 2024, the number of Green Heat measures installed decreased by 21% compared to 2023 levels primarily due to a 19% drop in the number of installed MSHPs and a 36% drop in the number of installed demand reduction measures, as illustrated in Figure 43 below. The decrease in installed measures has been observed for three consecutive years now and has been attributed to the launch of the Canada Greener Homes Grant (CGH Grant) by the federal government in May 2021. During those years, a portion of participants opted to enroll in HEA and the CGH Grant rather than Green Heat to access higher federal incentives. Since the CGH Grant was closed to new applicants on February 5, 2024, it is possible that Green Heat participation will increase once again in the upcoming years.

**Figure 43: Overview of Green Heat Participation, 2015-2024**

As indicated in Figure 44 below, Green Heat recorded its lowest savings levels in more than 10 years in 2024, which was 70% lower than 2023 levels. This was due to the combination of lower number of measures installed as well as significantly reduced claimed savings for MSHPs and wood-burning equipment in light of billing analysis results, as presented in Subsection 19.2.2 below.

**Figure 44: Evolution of Green Heat Gross Savings, 2014-2024**

## 18 Green Heat Evaluation Approach

The 2024 Green Heat evaluation comprised a comprehensive impact evaluation.

The main objectives of the evaluation were as follows:

- › Calculate gross and net results, namely electrical first-year and lifetime energy savings, peak demand savings, as well as avoided GHG emissions

In 2024, the Evaluator identified key research questions aimed at achieving the above objectives. Table 42 outlines the evaluation objectives and maps them to the Evaluator's research questions and methods. Each method is described further below.

**Table 42: 2024 Green Heat Evaluation Approach**

| Evaluation Objectives   | Research Questions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Methodology                                                                                                                                                                                                                               |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### Tracking Sheet Audit

Prior to performing the savings review, the Evaluator performed an audit of the final 2024 tracking sheet to ensure it was complete and the entered data were consistent. The detailed protocol used for the tracking sheet audit and the results obtained are presented in Appendix XXIII.

### Billing Analysis

After inconclusive results in 2023, a billing analysis was again conducted for Green Heat as part of the 2024 DSM evaluation to obtain measured electrical energy savings generated through the installation of MSHPs and wood or pellet stoves or fireplace inserts. The results were used to update the unitary savings values for these measures. MSHPs are the most significant measures in Green Heat, followed by wood or pellet stoves or fireplace inserts. The 2024 billing analysis served to update the results of a 2017 billing analysis for MSHPs, while it was conducted for the first time on wood or pellet stoves or fireplace inserts since the resulting measure savings were previously estimated using energy modelling as part of the 2013 evaluation. The detailed approach used for the billing analysis is presented in Appendix XXIV.

## Past Participant Survey

A total of 240 Green Heat participants composed of 204 MHSP participants and 36 wood/pellet stove or fireplace insert participants took part in a web survey in October 2024. The past participant survey served to collect information on participants that were included in the billing analysis and provide insight to establish billing analysis results. More specifically, participants were asked about changes they had made to their homes as part of their renovation project that included the installation of a heat pump or wood stove as well as whether they had air conditioning prior to project implementation. The survey questionnaire used is presented in Appendix XXI, and complete survey results are outlined in Appendix XXII.

Table 43 presents the total number of Green Heat participants included in the analysis with the obtained sample sizes as well as the corresponding margins of error at a 90% confidence level for the 2024 web survey. For biomass measures, the achieved sample size was slightly too small to meet the 10% margin of error target.

**Table 43: 2024 Green Heat Past Participant Survey Sample Sizes and Margins of Error**

| Measure | Population Included in Billing Analysis | Sample Size | Sampling Margin of Error at 90% Confidence Level |
|---------|-----------------------------------------|-------------|--------------------------------------------------|
| MSHPs   | 1,132                                   | 204         | ±5.2%                                            |
| Biomass | 213                                     | 36          | ±12.9%                                           |

## Unitary Savings Review

A unitary savings review was conducted for all measures, excluding measures that relied on a billing analysis, as part of the major update to the 2024-2025 Demand-side Measure Assessment (DSM MA).<sup>46</sup> The unitary savings review entailed a literature review of technical reference manuals, metering studies, and program evaluations to determine if there were more appropriate<sup>47</sup> methodologies or parameters to be applied to calculate energy and peak demand unitary savings, including elements such as baseline assumptions, operation hours, efficiency levels, peak demand-to-energy ratios, and interactive effect factors.

## EUL Update

For the 2024 evaluation, the Evaluator conducted a review of all EUL values as part of the 2024-2025 DSM MA update to determine if there were more appropriate EUL estimates.

## Calculations Using Evaluation Results

Building on all the above methods and collected data, the Evaluator calculated the first-year and lifetime energy and peak demand savings as per the calculation methodology presented in Section 19 below.

<sup>46</sup> The 2024-2025 DSM MA is a reference document that provides an in-depth review of all parameters necessary to calculate the annual and lifetime gross energy and peak demand savings of most prescriptive measures and some semi-prescriptive measures offered through E1's DSM program portfolio. In addition, the DSM MA includes effective useful life values for all measures offered in E1's program portfolio. For the evaluations conducted during the last two years of the 2023-2025 DSM cycle, the Evaluator refers to the values presented in the 2024-2025 DSM MA.

<sup>47</sup> The Evaluator will judge whether new studies are more appropriate based on various factors, including but not limited to the following: The similarities between the measures implemented in the given study and E1's measures, the similarities in terms of climate or market conditions, the size of the sample studied, whether a study is recent, the quality of the study methodology, etc.

## GHG Emission Reduction Calculations

To obtain net avoided GHG emissions in CO<sub>2</sub> eq for Green Heat, the Evaluator multiplied net energy savings by the latest Nova Scotia-specific factor for GHG emissions generated by electricity production. This factor was established using Nova Scotia Power (NS Power) data.

### Note on Margin of Error

For evaluation activities that yield quantitative results based on a sample, the Evaluator aimed to achieve a maximum margin of error of 10% at a confidence level of 90%. This means that, if measurements were conducted many times with different samples, the data would be within 10 percentage points above or below the percentage reported 90% of the time. Thus, the margin of error indicates the relative level of precision<sup>48</sup> of a measurement, while its associated confidence level indicates the probability of a measurement falling within the margin of error.<sup>49</sup>

As part of the 2024 Green Heat evaluation, the Evaluator calculated the margins of error for the unitary energy savings that were obtained from the billing analysis for MSHPs and wood or pellet stoves or fireplace inserts. The margins of error are listed alongside results in the applicable sections below. As it is often the case with billing analyses, there was a high variability in savings from one participant to another, and using all available participants did not allow to reach margins of error that were within the target. The Evaluator therefore kept results with higher margins of error as those represent the best available estimate; the Evaluator ensured that the results were statistically significant, meaning that the absence of savings could reasonably be excluded based on the corresponding confidence interval. Examples of calculations used to establish margins of error are provided in Appendix II of the 2024 DSM Programs Evaluation Executive Summary.

---

<sup>48</sup> Precision refers to how reproducible a set of measurements is. It does not take into account how close the measured values are to the true values since this would refer to accuracy.

<sup>49</sup> As part of this evaluation, confidence levels and margins of error only take random sampling errors into account; they do not reflect non-sampling errors or biases such as data entry errors, inaccurate responses from respondents, or the inability to contact certain people.

## 19 Green Heat Impact Evaluation

The objectives of the 2024 Green Heat impact evaluation were to determine gross and net electrical energy and peak demand savings, annually avoided GHG emissions, as well as effective useful life (EUL) values and associated lifetime energy savings.

### 19.1 Tracking Sheet Audit

To ensure program component results were reliably compiled, the Evaluator first performed a tracking sheet audit aimed at verifying the completeness and consistency of the data submitted by E1. The verification and corrective actions taken by the Evaluator, where applicable, are described in detail in Appendix XXII. The tracked savings results presented in this report therefore refer to the corrected tracked savings obtained by the Evaluator.

### 19.2 Gross Savings

For Green Heat, gross savings correspond to the change in energy consumption resulting from actions taken by participants regardless of their reasons for participating.<sup>50</sup> For the 2024 evaluation, the Evaluator relied on the values presented in the 2024-2025 DSM MA.

#### 19.2.1 Installation Rates

Installation rates represent the proportion of measures recorded in the tracking sheet and that remains installed in participants' homes. Installation rates for all energy efficient heating systems under Green Heat were estimated at 100% due to their relatively high cost, and this assumption was not changed as part of the 2024-2025 DSM MA update.

#### 19.2.2 Unitary Energy Savings

To establish Green Heat unitary savings, the Evaluator relied on a combination of billing analyses, energy models, engineering algorithms, and literature reviews. The 2024-2025 DSM MA provides a detailed description of inputs, references, and unitary savings calculations for all measure categories. The following subsections present the results of the billing analysis for MSHP measures and wood/pellet stoves and fireplace inserts, followed by a summary of the updates to unitary savings (including all measures reviewed based on a literature review as part of the 2024-2025 DSM MA major update).

---

<sup>50</sup> Definition adapted from National Renewable Energy Laboratory, The Uniform Methods Project Chapter 23: Estimating Net Savings: Common Practices, September 2014, p. 3.

## Billing Analysis

The billing analysis consisted of calculating the change in electrical energy consumption by comparing levels before and after participation in Green Heat for a group of recent participants (treatment group). To account for variations in electrical energy consumption due to factors other than Green Heat participation, the Evaluator selected a control group of Green Heat participants from previous years and deducted the change in electrical energy consumption observed for that group over the same period (difference-in-differences approach). Subtracting the change in control group electrical energy consumption (i.e. a change that is not linked to the program component) from that of the treatment group ensures that only savings attributable to Green Heat are captured and avoids capturing other effects that can have an impact on energy consumption (e.g. the COVID-19 pandemic) because both the treatment and control groups are impacted by such effects.

As stated previously, the billing analysis results were used to update unitary savings for MSHPs and wood or pellet stoves or fireplace inserts, which are presented in the remainder of this subsection and in Subsection 19.2.3 below. Past participant survey results were used to remove from the billing analysis participants who, as part of their Green Heat renovation project, also added heated floor area (i.e. by building an extension to their home or by starting to heat existing rooms that were not previously heated). The detailed approach used for the billing analysis is presented in Appendix XXIV.

## Summary of Updates to Unitary Energy Savings

Table 44 below summarizes the tracked and evaluated unitary energy savings values of each measure installed through Green Heat and for which there was an update in the 2024-2025 DSM MA.

The MSHP and wood/pellet stove and fireplace insert unitary savings were updated as per the results of the billing analysis described above. The Evaluator maintained the same unitary savings values for all other measures.

**Table 44: 2024 Green Heat Tracked and Evaluated Unitary Energy Savings**

| Measure                                                                                                                                                                                           | Tracked Savings | Evaluated Savings |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|-------------------|
| <b>Heat Pumps</b>                                                                                                                                                                                 |                 |                   |
| MSHPs – Fully Electrically Heated                                                                                                                                                                 | 0.179 kWh/Btu/h | 0.0855 kWh/Btu/h* |
| MSHPs – Mainly Electrically Heated**                                                                                                                                                              | 0.060 kWh/Btu/h | 0.000 kWh/Btu/h   |
| <b>Biomass</b>                                                                                                                                                                                    |                 |                   |
| Wood Stoves with Electric Resistance Baseline                                                                                                                                                     | 10,443 kWh/year | 1,461 kWh/year    |
| Wood Stoves with Heat Pump Baseline                                                                                                                                                               | 4,747 kWh/year  | 1,461 kWh/year    |
| Pellet Stoves with Electric Resistance Baseline                                                                                                                                                   | 8,959 kWh/year  | 1,461 kWh/year    |
| Pellet Stoves with Heat Pump Baseline                                                                                                                                                             | 4,072 kWh/year  | 1,461 kWh/year    |
| Wood Fireplace Inserts with Electric Resistance Baseline                                                                                                                                          | 10,443 kWh/year | 232 kWh/year      |
| Wood Fireplace Inserts with Heat Pump Baseline                                                                                                                                                    | 4,747 kWh/year  | 232 kWh/year      |

| Pellet Fireplace Inserts with Heat Pump Baseline                                                                                                                                                  | 4,072 kWh/year  | 232 kWh/year      |
| Wood Furnaces or Boilers with Heat Pump Baseline                                                                                                                                                  | 6,275 kWh/year  | 7,669 kWh/year    |
| Pellet Furnaces or Boilers with Heat Pump Baseline                                                                                                                                                | 6,257 kWh/year  | 7,647 kWh/year    |
| *Unitary savings expressed in kWh/Btu/h are applied to individual MSHPs heating capacity to obtain unitary savings specific to each MSHP. On average, this represents 1,460 kWh per MSHP in 2024. |                 |                   |
| **Mainly electrically heated refers to households with an electric primary heating system and a non-electric secondary heating system.                                                            |                 |                   |

A detailed analysis of the variation between the tracked and evaluated savings is presented in Appendix XXIV, and the Evaluator lists the key points of that analysis below.

- › The unitary savings for MSHPs decreased significantly. The reduction is partially due to changes in the methodology, such as adding a control group to the pre-post billing analysis, although savings did decrease beyond methodology changes when comparing to the 2017 billing analysis. The Evaluator compared the results obtained for MSHPs in Green Heat to those for HEA participants who only installed MSHPs and found that the results were similar. Furthermore, a literature review was conducted to compare the results of this 2024 billing analysis to other similar and recent studies in other jurisdictions, the results of which supported the validity of these new results.
- › Electrical energy savings for MSHPs in mainly electrically heated households were found to be nil. Since the billing analysis was based only on electricity consumption, it was not possible to measure non-electrical savings, which does not mean that MSHPs do not generate non-electrical savings. In fact, the Evaluator considers that the most likely reason for seeing no electrical energy savings is that the increase in electricity consumption due to transferring a portion of heating consumption from wood or oil to an electric heat pump cancels out the electricity savings achieved by replacing some electric resistance heating by the heat pump.
- › The unitary savings for wood or pellet stoves were decreased by a large margin. This change was mostly due to a change in methodology because the previous estimate of electrical energy savings was not based on a pre- and post-installation comparison of electricity consumption. Rather, it was based on a HOT2000 simulation for which only the post-installation period was calibrated to match electricity bills. This approach assumed that any consumption below the simulated consumption for 100% electric resistance space heating was fully met by the stoves and fireplace inserts,<sup>51</sup> while in fact it appeared that the space heating load was overestimated, and that the energy savings were overestimated as a result.
- › While wood or pellet fireplace inserts represented only a small portion of the biomass measures included in the billing analysis, the average savings measured for this measure were significantly lower than that of wood or pellet stoves. The Evaluator therefore separated the wood or pellet fireplace inserts from the other biomass measures in the billing analysis results. The savings obtained for this measure are not statistically significant (meaning that the margin of error on the value is larger than the savings value itself).

### 19.2.3 Unitary Peak Demand Savings

Peak demand savings correspond to the demand savings that coincide in time with the peak demand period of the electricity system. The projected electricity peak demand period in Nova Scotia is defined as the coldest days (with an on-peak temperature estimated at -15°C) between 5 p.m. and 7 p.m. in the months of December to February on non-holiday weekdays.

For MSHPs, unitary peak demand savings are calculated individually for each system installed. Since the billing analysis resulted in nil electrical energy savings for homes mainly electrically heated with MSHPs, no peak demand savings were claimed for those installations. Peak demand savings calculations for homes fully electrically heated with MSHPs remained unchanged since the electrical energy savings results are not used to calculate peak demand savings.

For wood or pellet stoves or fireplace inserts, in light of the significant reduction in unitary energy savings resulting from the billing analysis, the Evaluator also adjusted the peak demand savings. This change was necessary because the tracked peak demand savings were based on the assumed heating load obtained from the energy simulations mentioned in Subsection 19.2.2 above, and these were no longer valid as proven by the billing analysis. Therefore, the peak demand savings were reduced by the ratio of evaluated electrical energy savings to tracked electrical energy savings.

---

<sup>51</sup> Econoler, *Green Heat 2013 DSM Evaluation*, Report prepared for Efficiency Nova Scotia Corporation, February 21, 2014, p. 25.

Table 45 below summarizes the evaluated unitary peak demand savings values for each measure installed through Green Heat for which there was an update in the 2024-2025 DSM MA. The detailed rationale and calculations for these changes are presented in the 2024-2025 DSM MA.

**Table 45: 2024 Green Heat Tracked and Evaluated Unitary Peak Demand Savings**

| Measure                                                      | Tracked Peak Demand Savings [W] | Evaluated Peak Demand Savings [W] |
|--------------------------------------------------------------|---------------------------------|-----------------------------------|
| <b>Biomass</b>                                               |                                 |                                   |
| Wood Stoves with Electric Resistance Baseline                | 4,000                           | 828                               |
| Wood Stoves with Heat Pump Baseline                          | 4,000                           | 828                               |

| Pellet Fireplace Inserts with Electric Resistance Baseline   | 4,000                           | 132                               |
| Pellet Fireplace Inserts with Heat Pump Baseline             | 4,000                           | 132                               |
| Pellet Furnaces or Boilers with Electric Resistance Baseline | 7,775                           | 7,750                             |
| Pellet Furnaces or Boilers with Heat Pump Baseline           | 7,775                           | 7,750                             |

### 19.2.4 Interactive Effects

In a home, interactive effects occur when the implementation of energy efficiency measures has an impact on the energy consumption of other elements such as heating and cooling. Since Green Heat high-efficiency heating measures directly target heating and cooling loads, the impact of those measures on heating and cooling is considered in the unitary savings. Therefore, no additional interactive effects factors were applied to the savings of all measures because the interactive effects factor for each measure is assumed to be nil. This assumption remained valid in 2024.

### 19.2.5 Effective Useful Life

As part of the 2024-2025 DSM MA activities, the Evaluator reviewed the EUL values used in the calculations of electrical energy savings that are expected to persist over time. All EUL values used in previous years remained unchanged in the 2024-2025 DSM MA.

The equivalent EUL values are applied to the gross and net first-year electrical energy savings of each measure to obtain the gross and net lifetime electrical energy savings. As a result, the weighted average EUL values for gross and net savings differ (see Subsections 19.2.6 and 19.3 below). The gross weighted average EUL value is equal to 18.0 years.

## 19.2.6 Evaluated Gross Savings

The annual gross savings for each category of measure installed through Green Heat in 2024 are listed in Table 46 below.

The gross savings at the generator were estimated by using a line loss factors associated to the rate code of each participant. The line loss factors correspond to the values submitted to the Nova Scotia Utility and Review Board (NSUARB) as part of the 2014 Cost of Service Study Progress Update.<sup>52</sup>

---

<sup>52</sup> Nova Scotia Utility and Review Board, Matter M06555, 2014 Cost of Service Study Progress Update, Exhibit N-2.09, Appendix I1. For municipal utility participants, the line loss factor of the most similar NS Power rate code was assumed. If a municipal utility participant did not have any specific rate code, the average of participants for which the line loss was known was used.

Figure 45 below compares tracked gross electrical energy savings to evaluated gross electrical energy savings at the generator. As outlined in the figure, tracked and evaluated electrical energy savings are the same for solar measures, demand response measures, as well as CASHPs and AWHPs, but evaluated electrical energy savings were significantly lower for the two measures that generate the most savings, namely biomass measures and MSHPs for which the unitary savings were updated as part of the 2024-2025 DSM MA.

**Figure 45: 2024 Green Heat Tracked and Evaluated Gross Electrical Energy Savings at the Generator (GWh)**

Figure 46 below compares tracked gross peak demand savings to evaluated gross peak demand savings at the generator. A similar trend as for electrical energy savings is illustrated in this figure.; for biomass measures and MSHPs, the reduction in unitary savings led to significantly lower evaluated peak demand savings than tracked peak demand savings.

**Figure 46: 2024 Green Heat Tracked and Evaluated Gross Peak Demand Savings at the Generator (MW)**

As presented in Table 47, GHG emission reductions were calculated by applying the Nova Scotia-specific factor<sup>53</sup> for GHG emissions generated by electricity production to Green Heat gross electrical energy savings.

**Table 47: Evaluated 2024 Green Heat GHG Gross Emission Reductions**

|                                                                                             | Total        |
|---------------------------------------------------------------------------------------------|--------------|

## 19.3 Net Savings

The Evaluator determined the net energy and peak demand savings, i.e. the electrical energy and peak demand savings that can be reliably attributed to a program component, by estimating the NTGR. More precisely, the NTGR includes effects such as free-ridership and spillover that positively or negatively affect both the energy savings and peak demand savings generated by a program component. In the case of Green Heat, only free-ridership is considered.

### 19.3.1 Free-ridership

For Green Heat, free-ridership occurs when participants would have still installed a new, more efficient heating system in the absence of the program component.

Free-ridership was assessed during the 2023 evaluation using a self-reporting approach with participants. Since no data-collection activities aimed at updating the free-ridership levels were conducted for 2024, the 2023 levels were used for the 2024 evaluation for all measures.

Table 48 outlines the free-ridership levels used for 2024 along with 2023 survey parameters.

**Table 48: 2024 Green Heat Average Free-ridership Levels**

| Measure                                                                                                                                                                                                                                                      | Average Free-ridership Level | Sample Size | Population Size | Margin of Error |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|-------------|-----------------|-----------------|
| MSHPs                                                                                                                                                                                                                                                        | 48%                          | 90          | 1,132           | 5.5%            |
| Biomass Measures                                                                                                                                                                                                                                             | 47%                          | 29          | 213             | 8.2%            |
| Demand Reduction Measures                                                                                                                                                                                                                                    | 9%                           | 5           | 314             | 13.4%           |
| CASHPs and AWHPs*                                                                                                                                                                                                                                            | 33%                          | 30          | 54              | 7.6%            |
| *CASHPs and AWHPs free-ridership levels were not measured in 2023 due to the very low number of participants that installed this measure. The free-ridership results presented above for these two measures were established as part of the 2021 evaluation. |                              |             |                 |                 |

<sup>53</sup> At the time of writing, 2024 data were not yet available. The Nova Scotia-specific factor was obtained from Nova Scotia Power's 2023 total system emissions data (4,931,152 CO2 eq tonnes) and total electricity generation (10,442 GWh) was drawn from the following two sources: Nova Scotia Power, Total System Emissions, <https://www.nspower.ca/clean-energy/air-emissions-reporting> (last accessed September 27, 2024) and Emera Inc., Emera Inc. 2023 Annual Report, p. 31, available at [https://s25.q4cdn.com/978989322/files/doc\\_financials/2023/ar/Emera\\_2023\\_AR\\_FINAL.pdf](https://s25.q4cdn.com/978989322/files/doc_financials/2023/ar/Emera_2023_AR_FINAL.pdf) (last accessed September 27, 2024).

### 19.3.2 Net-to-gross Ratio Calculation

The NTGR was calculated using the following equation.

$$NTGR = (1 - \% \text{ Free-ridership})$$

Using the free-ridership level established for each measure category, the Evaluator calculated the NTGR values presented in Table 49.

**Table 49: 2024 Green Heat NTGRs**

| Measure                    | Free-ridership | NTGR |
|----------------------------|----------------|------|
| MSHPs                      | 48%            | 0.52 |
| Biomass and Solar Measures | 47%            | 0.53 |
| Demand Reduction Measures  | 9%             | 0.91 |
| CASHPs and AWHPs           | 33%            | 0.67 |

### 19.3.3 Evaluated Net Savings

Net savings are defined as the energy use reductions specifically attributable to Green Heat. Net savings were estimated by applying the NTGRs listed above to the evaluated gross savings using the following equation.

$$\text{Net Savings} = \text{Gross Savings} \times \text{NTGR}$$

This equation was used to calculate both electrical energy savings and peak demand savings.

The detailed results are presented in Table 50 below. The net electrical energy savings resulted in 412 tonnes of CO<sub>2</sub> eq in net annual GHG emission reductions.

**Table 50: Evaluated 2024 Green Heat Net Electrical Energy and Peak Demand Savings**

| Measure                                              | MSHPs            |                   | CASHPs | AWHPs  |
|------------------------------------------------------|------------------|-------------------|--------|--------|
|                                                      | Fully Electrical | Mainly Electrical |        |        |

As outlined in Figure 47, Green Heat fell short of both its electrical energy and peak demand savings targets by 76% and 45% respectively.

**Figure 47: 2024 Green Heat Targets and Evaluated Savings**

## 19.4 Realization Rate

Table 51 below compares the energy and peak demand savings established through the 2024 evaluation to those calculated in the 2024 tracking sheet. It also includes the realization rate, representing the ratio of evaluated net savings to tracked net savings, for both energy savings and peak demand savings.

**Table 51: Comparison of 2024 Green Heat Tracked and Evaluated Savings at the Generator**

|                                                                                                                                                                  | Gross Savings |      | NTGR* | Net Savings |      | Realization Rate |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|------|-------|-------------|------|------------------|
|                                                                                                                                                                  | Value         | Unit |       | Value       | Unit |                  |
| Energy Savings                                                                                                                                                   |               |      |       |             |      |                  |
| Tracked Savings by E1                                                                                                                                            | 4.711         | GWh  | 0.53  | 2.478       | GWh  | 35%              |
| Evaluation Results                                                                                                                                               | 1.651         | GWh  | 0.53  | 0.872       | GWh  |                  |
| Peak Demand Savings                                                                                                                                              |               |      |       |             |      |                  |
| Tracked Savings by E1                                                                                                                                            | 3.915         | MW   | 0.55  | 2.143       | MW   | 71%              |
| Evaluation Results                                                                                                                                               | 2.748         | MW   | 0.56  | 1.529       | MW   |                  |
| *NTGRs varied for each measure category. The NTGRs presented in this table correspond to the rounded averages obtained by dividing net savings by gross savings. |               |      |       |             |      |                  |

The evaluated gross electrical energy and peak demand savings determined by the Evaluator were significantly lower than the initial gross savings tracked by E1. This is explained by the lower unitary savings for MSHPs and biomass measures as a result of the billing analysis. For the same reasons, net electrical energy and peak demand savings were also lower than the tracked values, although the reduction is less significant than for energy savings.

## 20 Green Heat Key Findings and Recommendations

As mentioned previously, the main objectives of the 2024 Green Heat evaluation were as follows:

- › Calculate gross and net results, namely electrical first-year and lifetime energy savings, peak demand savings, as well as avoided GHG emissions

This section provides the Evaluator's key findings in relation to the above objectives.

**2024 Green Heat-Finding: Green Heat fell short of its net savings targets, achieving 24% and 55% of its electrical energy and peak demand targets respectively.**

Green Heat achieved 0.872 GWh in net electrical energy savings and 1.529 MW in net peak demand savings at the generator in 2024, thus falling short of the planned net electrical energy savings of 3.600 GWh and net peak demand savings of 2.775 MW. While lower than expected participation partially explains part of the missed targets, the primary reason is the low realization rates that were obtained through the billing analyses conducted for the 2024 evaluation, as described below.

**2024 Green Heat-Finding: Green Heat participation decreased for the third consecutive year.**

Green Heat participation levels decreased by 21% compared to 2023 levels, particularly for MSHPs (19% reduction) and demand reduction measures (36% reduction). The decrease in the number of installed measures has been observed for three consecutive years and has been attributed to the launch of the CGH Grant by the federal government in May 2021. During those years, a portion of participants opted to enroll in HEA and the CGH Grant rather than Green Heat to access higher federal incentives. Since the CGH Grant was closed to new applicants on February 5, 2024, it is possible that Green Heat participation will increase once again in the upcoming years.

**2024 Green Heat-Finding: Both the evaluated gross electrical energy and peak demand savings were significantly lower than the savings tracked by E1.**

Green Heat underwent a comprehensive impact evaluation in 2024. Following the billing analysis results, significant changes were made by the Evaluator to gross electrical energy and peak demand savings parameters and calculations, which resulted in low realization rates of 35% and 71% for net electrical energy savings and net peak demand savings respectively. These significant reductions between tracked and evaluated savings are explained by the lower unitary savings for MSHPs and biomass measures. Most notably, unitary energy savings for MSHPs in fully electrically heated households were reduced by half, those in mainly electrically heated households were found to be nil, and those for wood stoves, pellet stoves, and fireplace inserts were reduced by 83% on average.

**Recommendation #1: Consider removing wood fireplace inserts and pellet fireplace inserts from the Green Heat offer.** In light of the very low savings with no statistical significance and considering the low uptake of these measures, the Evaluator recommends re-evaluating the program component offering for wood fireplace inserts and pellet fireplace inserts

**2024 Green Heat-Finding:** The nil electrical energy savings found for mainly electrically heated households as part of the billing analysis now suggests that the increase in electricity consumption due to transferring a portion of the heating consumption from wood or oil to an electric heat pump cancels out the electricity savings achieved by replacing some electric resistance heating by a heat pump. While DSM savings only consider electrical savings, there are most likely other fuel savings occurring for these participants.

## 21 HEA Overview

This section describes Home Energy Assessment (HEA), follows up on past evaluation recommendations, and provides an overview of participation history.

### 21.1 HEA Description

HEA is a home energy evaluation-based program component that encourages homeowners to improve the energy efficiency and comfort of their homes by providing them with related information and financial incentives in the form of rebates. HEA uses the EnerGuide home evaluation framework and is administered in collaboration with Natural Resources Canada (NRCan). Figure 48 illustrates the participation process along with details about the program component.

**Figure 48: HEA Participation Process Summary**

Since 2018, HEA offers the same services to non-electrically heated homes. This report presents the evaluation results for electrical measures only.

In May 2021, the federal government announced the launch of the Canada Greener Homes (CGH) Grant. The initiative offered grants of up to \$5,000 to help homeowners implement energy efficiency retrofits in their primary residences. In Nova Scotia, the CGH Grant was co-delivered by E1 through HEA. On 5 February 2024, the CGH Grant was closed to new applications, which means that measures solely funded by the CGH Grant, namely resiliency measures (batteries for solar PV, roofing membranes, foundation water proofing, and moisture proofing), solar PV, and smart thermostats, are no longer available for applicants after this date.

At the end of 2022, low uptake measures (air-to-water heat pumps, solar air equipment, and drain water heat recovery) as well as demand reduction measures (electric thermal storage [ETS] units, three-element water heaters, domestic hot water [DHW] heater timers) were removed from the offering. Rebates for those measures are honoured for customers who enrolled prior to these changes taking effect.

HEA was aimed at achieving 19.012 GWh in net electrical energy savings and 4.799 MW in net peak demand savings at the generator in 2024.

## 21.2 Follow-up on Past Evaluation Report Recommendations

The Evaluator evaluated HEA in previous years and issued improvement recommendations. Table 52 below provides a summary of the implementation status of past recommendations that were carried forward. The Evaluator notes that all remaining recommendations were completed in 2024.

**Table 52: Implementation Status of Past Recommendations for HEA**

| #               | Past Recommendations                                                                                                                                                                                                                              | Status   | Comments                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2018<br>HEA-R1  | Conduct a billing analysis to review overestimation ratios (ORs) when a sufficient participant sample becomes available.                                                                                                                          | Complete | A billing analysis has been planned for 2022 to reassess the overestimation ratio. The billing analysis was deferred in 2022 due to the number of participants with sufficient billing data being too low to establish reliable overestimation ratio values for subcategories of participants. In 2022, the Evaluator researched potential changes to the billing analysis approach and the savings calculation methodology to produce more robust savings values in future evaluations and simplify savings calculations. The proposed new billing analysis approach was described in the 2023 Existing Residential evaluation report. The Evaluator performed a billing analysis using the abovementioned new approach in 2023, although the results thereof were inconclusive. The Evaluator and E1 further explored the results of the 2023 billing analysis to adjust the billing analysis approach for the 2024 evaluation, which made it possible to review the ORs and replace them with adjustment ratios (ARs). |
| 2020<br>HEA-R1  | Update the unconverted D assessment spillover calculation assumptions to reflect the current participation mix and obtain more representative results.                                                                                            | Complete | In 2022, the Evaluator analyzed the evolution of the average savings per electrical participant to determine if an adjustment to the savings value per unconverted D assessment should be applied to align with changes in HEA since the unconverted D assessment spillover study was conducted. The analysis revealed that no adjustment was needed, although the Evaluator still recommended that new activities be conducted to reassess all parameters used to calculate unconverted D assessment spillover savings. The Evaluator updated these parameters in the 2024 evaluation and the results are presented in this report.                                                                                                                                                                                                                                                                                                                                                                                      |
| 2023-<br>HEA-R1 | Continue exploring the factors potentially responsible for the inconclusive billing analysis results, one being related to billing data interpretation, and work with the Evaluator to define the impact evaluation approach to be taken in 2024. | Complete | E1 and the Evaluator worked to define a new impact evaluation approach for the 2024 evaluation, which consisted of using AMI data for the billing analysis.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## 21.3 Participation History

As presented in Figure 49 below, HEA participation levels<sup>54</sup> have constantly and significantly increased since 2022, which is likely due to the introduction of the CGH Grant. In 2024, HEA participation increased by 31% compared to the 2023 level to once again reach a new record.

Average gross energy savings per participant remained stable for 2024 and were among the highest levels in program history. Between 2021 and 2022, an increase of 26% was observed. Between 2022 and 2023, the increase was of 57%, and for 2024, only a slight decrease of 3% was observed compared with 2023. The increases in recent years are mainly explained by solar PV measures installed through HEA as a result of the CGH Grant offered since May 2021. The CGH Grant was closed to new applicants on 5 February 2024. Hence, solar PV measures will no longer be offered through HEA, which should result in substantial participation and gross energy savings decreases in the upcoming years. In 2024, solar PV measures represented 74% of gross energy savings. It should be noted that, prior to July 2018, HEA was only offered to electrically heated homes and thus generated more electrical energy savings per participant. This explains why average gross energy savings per participant were higher in previous years, then decreased and started increasing again with the introduction of solar PV measures.

**Figure 49: Overview of HEA Participation, 2015-2024**

Figure 50 below provides an overview of the evolution of HEA gross energy and peak demand savings from 2015 to 2024. In 2024, an increase of 27% in gross energy savings was observed compared to 2023, a year in which record savings were achieved. Finally, peak demand savings increased by 15% compared to 2023, thereby also achieving record levels.

<sup>54</sup> In this DSM evaluation report, the number of participants refers to those participants whose projects generated electrical savings regardless of whether their homes are primarily electrically heated.

Figure 50: Evolution of HEA Gross Savings, 2015-2024

## 22 HEA Evaluation Approach

The 2024 HEA evaluation comprised a comprehensive impact evaluation.

The main objectives of the 2024 HEA evaluation were to:

- › Calculate gross and net results, namely electrical first-year and lifetime energy savings, peak demand savings, as well as avoided GHG emissions

The Evaluator identified key research questions aimed at achieving the above objectives. Table 53 outlines the evaluation objectives and maps them to the Evaluator's research questions, methods, and sample sizes (n). Each method is described further below.

**Table 53: 2024 HEA Evaluation Approach**

| Evaluation Objectives   | Research Questions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Methodology                                                                                                                                                                                                                                      |

### Tracking Sheet Audit

Prior to conducting the savings calculation review, the Evaluator performed an audit of the final 2024 tracking sheet to ensure it was complete and the entered data were consistent. The detailed protocol used for the tracking sheet audit and the results obtained are presented in Appendix XXX.

## Past Participant Survey

In the fall of 2024, Narrative Research conducted an online survey with a total of 483 past HEA participants. The objective was to collect information prior to conducting the billing analysis on these participants. The average length of the survey was 3.0 minutes. The questionnaire used is presented in Appendix XXVI, while complete survey results are outlined in Appendix XXVII. Drawing a random sample of 483 from a population of 1,963 yields a margin of error of +/- 3.3 percentage points at a 90% confidence level.

## Billing Analysis

A billing analysis was conducted to establish adjustment ratios to be directly applied to the savings estimates obtained from HOT2000. A lot of work was done prior to performing the billing analysis, notably to understand the information available in NRCan data to identify households with square footage changed between the D and E assessments, availability of AMI data for the treatment and control groups, as well as if anything from the literature could be applied to inform the billing analysis approach.

## Unitary Savings Review

Savings for some HEA measures are determined through a prescriptive approach based on unitary savings values. In 2024, the Evaluator did a complete review and update of unitary savings values and produced the 2024-2025 Demand-side Management Measure Assessment (DSM MA).<sup>55</sup> The unitary savings review entailed a literature review of technical reference manuals, metering studies, and program evaluations to determine if there are more appropriate methodologies or parameters to be applied to calculate energy and peak demand unitary savings, including elements such as baseline assumptions, operating hours, efficiency levels, peak demand-to-energy ratios, and interactive effect factors.

## EUL Update

For the 2024 evaluation, the Evaluator conducted a review of all EUL values as part of the 2024-2025 DSM MA update to determine if there were more appropriate EUL estimates.

## Expired Participant Survey

To reassess unconverted D assessment savings parameters, Narrative Research conducted a telephone survey with a total of 76 expired participants, i.e. participants who did not complete a final home energy assessment after the 12-month period following their initial D assessment. The survey was conducted in the fall of 2024 and its average length was 7.1 minutes. The questionnaire is presented in Appendix XXVIII, while complete survey results are outlined in Appendix XXIX. Drawing a random sample of 76 from a population of 2,542 yields a margin of error of  $\pm 9.3\%$  at a 90% confidence level.

---

<sup>55</sup> The 2024-2025 DSM MA is a reference document that provides an in-depth review of all parameters necessary to calculate the annual and lifetime gross energy and peak demand savings of most prescriptive measures and some semi-prescriptive measures offered through E1's DSM program portfolio. In addition, the MA includes effective useful life values for all measures offered in E1's program portfolio. For the remainder of the evaluations to be conducted during the 2023-2025 DSM cycle, the Evaluator will refer to the values presented in the 2024-2025 DSM MA.

## Site Visits

A total of 19 site visits were completed by EAs among surveyed expired participants who declared not having completed a final home energy assessment but still had some recommended measures installed. The site visits consisted of performing a final home energy assessment, confirm the installation of measures, and calculate the final energy simulation results with HOT2000.

## Calculations Using Evaluation Results

Building on all the above methods and collected data, the Evaluator calculated the first-year and lifetime electrical energy and peak demand savings as per the calculation methodology presented in Section 23 below.

## GHG Emission Reduction Calculations

To obtain net avoided GHG emissions in CO<sub>2</sub> eq for HEA, the Evaluator multiplied the net energy savings by the latest Nova Scotia-specific factor for GHG emissions generated by electricity production. This factor was established using Nova Scotia Power (NS Power) data<sup>56</sup>.

### Note on Margin of Error

For evaluation activities that yield quantitative results based on a sample, the Evaluator aimed to achieve a maximum margin of error of 10% at a confidence level of 90%. This means that, if measurements were conducted many times with different samples, the data would be within 10 percentage points above or below the percentage reported 90% of the time. Thus, the margin of error indicates the relative level of precision<sup>57</sup> of a measurement, while its associated confidence level indicates the probability of a measurement falling within the margin of error.<sup>58</sup>

As part of the 2024 HEA evaluation, the Evaluator calculated the margins of error for adjustment ratios obtained from the billing analysis. The margins of error are listed alongside results in the applicable sections below. Examples of calculations used to establish margins of error are provided in Appendix II of the 2024 DSM Programs Evaluation Executive Summary.

---

<sup>56</sup> At the time of writing, 2024 data were not yet available. The Nova Scotia-specific factor was obtained from Nova Scotia Power's 2023 total system emissions data (4,931,152 CO<sub>2</sub> eq tonnes) and total electricity generation (10,442 GWh) was drawn from the following two sources: Nova Scotia Power, Total System Emissions, <https://www.nspower.ca/clean-energy/air-emissions-reporting> (last accessed September 27, 2024) and Emera Inc., Emera Inc. 2023 Annual Report, p. 31, available at [https://s25.q4cdn.com/978989322/files/doc\\_financials/2023/ar/Emera\\_2023\\_AR\\_FINAL.pdf](https://s25.q4cdn.com/978989322/files/doc_financials/2023/ar/Emera_2023_AR_FINAL.pdf) (last accessed September 27, 2024).

<sup>57</sup> Precision refers to how reproducible a set of measurements is. It does not take into account how close the measured values are to the true values since this would refer to accuracy.

<sup>58</sup> As part of this evaluation, confidence levels and margins of error only take random sampling errors into account; they do not reflect non-sampling errors or biases such as data entry errors, inaccurate responses from respondents, or the inability to contact certain people.

## 23 HEA Impact Evaluation

The objectives of the 2024 HEA impact evaluation were to determine gross and net electrical energy and peak demand savings, annually avoided GHG emissions, as well as EUL values and associated lifetime energy savings.

### 23.1 Tracking Sheet Audit

To ensure program component results were reliably compiled, the Evaluator first performed a tracking sheet audit aimed at verifying the completeness and consistency of the data submitted by E1. The verification and corrective actions taken by the Evaluator, where applicable, are described in detail in Appendix XXX. The tracked savings results presented in this report therefore refer to the corrected tracked savings obtained by the Evaluator.

The HEA tracking sheet is very complex. The new savings calculation approach developed as part of this evaluation will help simplify the number and length of calculation steps for HEA. Moreover, HEA is transitioning into E1's Customer Information System (CIS), which should considerably facilitate data tracking. An example of data tracking that should be simplified is the heat pump parameters that are required for the peak demand savings calculation. Currently, the Evaluator validates these parameters by manually cross-referencing them with the Northeast Energy Efficiency Partnerships' (NEEP) ccASHP Specification and Product List, a process that has proven to be difficult with the current tracking sheet. Integration into the CIS should allow for easier validation of all heat pump parameters with their AHRI model number.

### 23.2 Gross Savings

For HEA, gross savings correspond to the change in energy consumption resulting from measures implemented by HEA participants regardless of their reasons for participating.<sup>59</sup> The following subsections describe how HEA gross savings are calculated and how each parameter of the methodology was determined.

#### 23.2.1 Installation Rates

Installation rates represent the proportion of products recorded in the tracking sheet and that remain installed in participant homes. Based on the 2024-2025 DSM MA, installation rates for all HEA measures were estimated at 100% because they are confirmed by EAs at the time of the E assessment.

---

<sup>59</sup> Definition adapted from: National Renewable Energy Laboratory, *The Uniform Methods Project Chapter 23: Estimating Net Savings: Common Practices*, September 2014, p. 3.

### 23.2.2 Energy Savings

HEA energy savings are calculated based on HOT2000 simulation results adjusted with billing analysis results and unitary savings values for prescriptive measures, as shown in the equation below.

$$\begin{aligned} \text{Gross Energy Savings (kWh)} = \\ (Total Elec_D(kWh) - Total Elec_E(kWh) - HPWH(kWh)) \times AR \\ + Savings for Prescriptive Measures (kWh) \end{aligned}$$

Where:

- › *Total Elec<sub>D</sub>* and *Total Elec<sub>E</sub>* correspond to the modelled electrical energy consumption levels respectively obtained in HOT2000 during the D and E assessments.
- › *HPWH (kWh)* correspond to the unitary savings value established for heat pump water heaters (HPWHs).
- › *AR* correspond to the adjustment ratio established through a billing analysis and used to adjust the savings obtained from the difference between the modelled electrical energy consumption during the D and E assessments. Adjustment ratios vary according to different space heating system scenarios.
- › *Savings for Prescriptive Measures* are obtained by multiplying the prescriptive measures installed through HEA by their respective unitary electrical energy savings value.

### Measures Modelled in HOT2000

After the D and E home energy assessments, EAs model the house in the HOT2000 energy simulation software to obtain the initial and final EnerGuide ratings of the given house. Energy consumption levels obtained from HOT2000 simulation results are used to determine the electrical energy savings for modelled measures. They correspond to the reduction in consumption level between the D and E assessments.

The methodology currently used to calculate tracked savings compares electrical space heating consumption levels for the two assessments, both of which are adjusted with an overestimation ratio (OR). The ORs were drawn from the results of billing analyses conducted during the 2015 and 2018 HEA evaluations. The 2018 evaluation established distinct ORs depending on the space heating system in place.

As part of the 2024 evaluation, the Evaluator made some changes to the current savings calculation methodology to make it more robust and simpler and conducted a new billing analysis. The Evaluator used the savings values obtained through the billing data to develop adjustment ratios that can be directly applied to the modelled savings estimates obtained from HOT2000 using whole home consumption (not only space heating).

The billing analysis consisted of calculating the change in electrical energy consumption by comparing levels before and after participation in HEA for a group of recent participants (treatment group). To account for variations in electrical energy consumption due to factors other than HEA participation, the Evaluator selected a control group and deducted the change in electrical energy consumption observed for that group over the same period. Subtracting the change in control group electrical energy consumption (i.e. a change that is not linked to the program component) from that of the treatment group ensures that only savings attributable to HEA are captured and avoids capturing other effects that can have an impact on energy consumption (e.g. the COVID-19 pandemic) because both the treatment and control groups are impacted by such effects.

Since the adjustment ratio is to be applied to the modelled savings values obtained from HOT2000, the billing analysis was conducted on participants who only implemented modelled measures. Hence, participants who installed wood burning equipment or solar photovoltaic (PV) measures through their participation in HEA were removed from the analysis.

The complete billing analysis methodology and results are presented in Appendix XXXI.

The adjustment ratios (ARs) obtained through the billing analysis performed as part of this evaluation are presented in Table 54 below. They were determined separately for three heat pump scenarios, as it was the case for ORs. The tracked ORs are also presented in the table for comparison. The values in brackets represent the values obtained when calculating the factor  $(1 - OR)$  that was multiplied with the D and E space heating consumption values. It is worth reminding that the ARs are directly applied to the savings values obtained from the difference between the total consumption values.

**Table 54: 2024 HEA Adjustment Ratios**

| Scenario                                                                            | Tracked                    |                            | Evaluated |
|-------------------------------------------------------------------------------------|----------------------------|----------------------------|-----------|
|                                                                                     | OR <sub>D</sub> Assessment | OR <sub>E</sub> Assessment | AR        |
| A participant who registered <b>with</b> a heat pump                                | 0% (1.00)                  | 0% (1.00)                  | 1.24      |
| A participant who registered <b>without</b> a heat pump and who did not install one | 19% (0.81)                 | 19% (0.81)                 | 0.58      |
| A participant who registered <b>without</b> a heat pump and then had one installed  | 19% (0.81)                 | 0% (1.00)                  | 0.43      |

## Prescriptive Measures

For some measures installed under HEA, instead of using a performance approach based on energy simulation results, energy savings are calculated using a prescriptive approach based on unitary energy savings values. This is the case for:

- › Wood burning equipment
- › Smart thermostats
- › Solar PV systems
- › HPWHs

Wood burning equipment, smart thermostats, and solar PV systems are not modelled in HOT2000, which is why unitary savings are used. It should be noted that, for smart thermostats introduced in HEA through the Canada Greener Homes (CGH) Grant, the unitary savings value for HEA is assumed to be nil considering the relatively high risk of double counting with Instant Savings given smart thermostats are also incented year-round through that program component.

For HPWHs, even if modelled in HOT2000, savings from this measure are deducted from the modelled savings (according to their unitary savings value) before applying the AR to the remaining modelled savings. HPWH savings are then added up as a prescriptive measure, again according to their unitary savings value. This approach avoids applying the AR on HPWH savings considering this measure was not captured in the billing analysis due to its low number of installations and will facilitate future savings accounting in conjunction with E1's HPWH market transformation pilot.

The detailed descriptions of inputs, references, and unitary savings calculations for all prescriptive measures are presented in the 2024-2025 DSM MA. Table 55 summarizes the tracked and evaluated unitary energy savings values of each measure for which there was an update in the 2024-2025 DSM MA.

**Table 55: 2024 HEA Tracked and Evaluated Unitary Energy Savings for Prescriptive Measures**

| Measure                                                                                                                                                                                                                                               | Tracked Savings<br>[kWh/year]  | Evaluated Savings<br>[kWh/year] |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------|---------------------------------|
| Wood Stoves or Fireplace Inserts with Electric Resistance Baseline                                                                                                                                                                                    | 10,443                         | 1,461**                         |
| Wood Stoves or Fireplace Inserts with Heat Pump Baseline                                                                                                                                                                                              | 10,443 / Annual Heat Pump COP* |                                 |
| Pellet Stoves or Fireplace Inserts with Electric Resistance Baseline                                                                                                                                                                                  | 8,959                          |                                 |
| Pellet Stoves or Fireplace Inserts with Heat Pump Baseline                                                                                                                                                                                            | 8,959 / Annual Heat Pump COP*  |                                 |
| *COP = coefficient of performance                                                                                                                                                                                                                     |                                |                                 |
| **Since the HEA tracking sheet does not track stove and fireplace insert measures separately, the Evaluator applied the unitary energy savings value for stoves drawn from the Green Heat billing analysis to all stove and fireplace inserts in HEA. |                                |                                 |

The new evaluated savings values for wood burning equipment, updated as part of a billing analysis activity performed for Green Heat, are no longer dependent on the type of wood burning or the heating system baseline (heat pump or electric resistance). Furthermore, evaluated energy savings values for stoves and fireplace inserts are now different in Green Heat. Since the HEA tracking sheet does not track these measures separately, it is not possible to allocate different unitary savings values for these products. Considering the small number of wood burning equipment installations in HEA (90 installations out of 7,264 participants), the Evaluator applied the unitary energy savings value for stoves to all stoves or fireplace inserts in HEA. As recommended in Green Heat moving forward, E1 should consider removing fireplace inserts from its offer considering the low savings associated with this measure.

## Reporting Requirements

HEA incentives originate from three sources of funding: Nova Scotia Power ratepayers for DSM, the Province of Nova Scotia, and the Government of Canada (CGH Grant). The incorporation of the CGH Grant, as a co-funder of the energy assessments and measures for both DSM and Province of Nova Scotia funding, has not changed anything in E1's evaluation reporting structure. Therefore, HEA savings are reported to two different parties, the Nova Scotia Utility and Review Board (NSUARB) and the Province of Nova Scotia respectively via the DSM evaluation reports and the government-funded evaluation reports.

The DSM evaluation is focused on reporting electrical savings achieved with electrical DSM investments, while the government-funded evaluation reporting requirements for HEA are focused on participation and GHG emission reductions achieved with government funding regardless of the type of fuel. To avoid double counting and determine the most appropriate way to report associated savings, equations for each possible scenario were developed. The equations and their rationales are presented in Appendix XXXII.

As for the solar PV measures introduced through HEA with the CGH Grant, since solar PV generation offsets electricity use and results in savings to the electric grid, solar PV measure savings are included in the DSM evaluation report for HEA regardless of participant heating source.

### 23.2.3 Peak Demand Savings

Peak demand savings correspond to the demand savings that coincide in time with the peak demand period of the electricity system. The projected electricity demand peak period in Nova Scotia is defined as the coldest days (with an on-peak temperature estimated at -15 °C) between 5 p.m. and 7 p.m. in the months of December to February on non-holiday weekdays.

For HEA, peak demand savings are calculated using a different approach for measures modelled in HOT2000 and prescriptive measures.

## Measures Modelled in HOT2000

For measures modelled in HOT2000, peak demand savings are calculated by applying a peak demand-to-energy ratio of 0.283 MW/GWh after having removed the energy savings associated with mini-split heat pumps. The energy savings value currently tracked for mini-split heat pumps is based on Green Heat. The value was updated as part of this evaluation based on the billing analysis conducted for HEA. Treatment participants who only installed a mini-split heat pump through their participation in HEA were isolated to calculate an average energy savings value per capacity installed of 0.0760 kWh/Btu/h. Peak demand savings are then calculated separately for mini-split heat pumps using the following equation.

$$MSHP \text{ Peak Demand Savings } (W) = \frac{1,000}{3.412} \times HC_{min} \times \left( \frac{1}{COP_{base\_min}} - \frac{1}{COP_{ee\_min}} \right)$$

The parameters used in this equation are outlined in Table 56 below.

**Table 56: Unitary Peak Demand Savings Values for Mini-split Heat Pumps**

| Variable                                                                                             | Symbol            | Value                                        |
|------------------------------------------------------------------------------------------------------|-------------------|----------------------------------------------|
| Rated heating capacity of the new heat pump at outdoor air temperature of -15 °C [kBTU/h]            | $HC_{min}$        | Specification data for each installed system |
| Coefficient of performance of the assumed baseline equipment (electric resistance) at -15 °C [kW/kW] | $COP_{base\_min}$ | 1                                            |
| Coefficient of performance of the new heat pump at -15 °C [kW/kW]                                    | $COP_{ee\_min}$   | Specification data for each installed system |
| Conversion factor [BTU/W·h]                                                                          | -                 | 3.412                                        |
| Conversion factor [W/kW]                                                                             | -                 | 1,000                                        |

As for the peak demand-to-energy ratio of 0.283 MW/GWh applied to the remaining energy savings modelled in HOT2000, the details are presented in the 2024-2025 DSM MA.

## Prescriptive Measures

For prescriptive measures, specific unitary peak demand savings values are used. The detailed calculations are presented in the 2024-2025 DSM MA, and the values of each measure for which there was an update are presented in Table 57. Again, for stoves and fireplace inserts, the Evaluator applied the unitary peak demand savings value for stoves from Green Heat since HEA does not track stoves and fireplace inserts separately.

**Table 57: 2024 HEA Tracked and Evaluated Unitary Peak Demand Savings for Prescriptive Measures**

| Measure                                                                                   | Tracked Savings [W] | Evaluated Savings [W] |
|-------------------------------------------------------------------------------------------|---------------------|-----------------------|
| Wood or pellet stoves or fireplace inserts with electric resistance or heat pump baseline | 4,000               | 828                   |

## Demand Reduction Measures

In the past, HEA offered incentives for demand reduction measures, namely electric thermal storage (ETS) units, three-element water heaters, and domestic hot water (DHW) heater timers. For these measures installed prior to the removal of those incentives from HEA, unitary peak demand savings values were established and remain unchanged.

### 23.2.4 Supplemental File Adjustments

Supplemental files refer to participants that have multiple files (or lines) in the tracking sheet. Supplemental files occur for multiple reasons that may or may not result in incremental energy savings. For example, a supplemental file can stem from administrative issues around incentive payments, which have no effect on energy savings. On the other hand, supplemental files can stem from the need to remodel a home, which would impact the savings for the given participant. For 2024, E1 performed the analysis and compiled the incremental savings from all supplemental files (i.e. the difference between what was claimed in the original file and what should have been claimed according to the updated supplemental file). The Evaluator considers that the approach adopted by E1 is thorough and allows for identifying most savings from supplemental files, especially considering the order of magnitude of such savings relative to total program savings.

Table 58 below summarizes the supplemental file adjustments for 2024. They result in a positive adjustment made to gross savings.

**Table 58: 2024 HEA Supplemental File Adjustments**

| Category                                                                                            | Values |
|-----------------------------------------------------------------------------------------------------|--------|
| Incremental gross energy savings at the meter for energy efficiency measures (GWh) <sup>1</sup>     | 0.044  |
| Incremental gross energy savings at the meter for solar PV measures (GWh)                           | 0.011  |
| Incremental gross peak demand savings at the meter for energy efficiency measures (MW) <sup>1</sup> | 0.023  |
| Incremental gross peak demand savings at the meter for solar PV measures (MW)                       | 0      |
| <sup>1</sup> Energy efficiency measures refer to all HEA measures except solar PV.                  |        |

### 23.2.5 Interactive Effects

In a home, interactive effects occur when the implementation of energy efficiency measures has an impact on the energy consumption of other elements such as heating and cooling. Since the vast majority of HEA measure savings are obtained from simulation results that already consider interactions between the heating and cooling systems, no additional interactive effects need to be accounted for. For wood burning equipment, since it directly targets heating loads, the impact of these prescriptive measures on heating is already considered in the unitary savings calculations. As for solar PV systems, savings are not impacted by interactive effects.

### 23.2.6 Effective Useful Life

As part of 2024-2025 DSM MA activities, the Evaluator reviewed the EUL values used in the calculation of electrical energy savings that are expected to persist over time. For the electrical energy savings that come from measures modelled in HOT2000, an average EUL value was established by calculating the weighted average of EUL values associated with the main building envelope measures and space heating equipment installed under HEA in 2024. For the prescriptive measures, the EUL values are directly applied to the unitary savings value.

The EUL values that were updated in the 2024-2025 DSM MA are presented in Table 59.

**Table 59: 2024 HEA Tracked and Evaluated Effective Useful Life Values**

| Measure                                                                       | Tracked EUL<br>[years] | Evaluated EUL<br>[years] |
|-------------------------------------------------------------------------------|------------------------|--------------------------|
| Measures Modelled in HOT2000 (i.e. Heat Pumps and Building Envelope Measures) | 20.8                   | 20.5                     |
| Heat Pump Water Heaters                                                       | 10.0                   | 15.0                     |
| Solar PV                                                                      | 25.0                   | 30.0                     |

The equivalent EUL values are applied to the gross and net first-year electrical energy savings of each measure category to obtain the gross and net lifetime electrical energy savings. As a result, the weighted average EUL values of gross and net savings differ (see Subsections 23.2.7 and 23.3.6 below). The gross weighted average EUL value is equal to 27.5 years.

### 23.2.7 Evaluated Gross Savings

The annual gross savings for each category of measures installed through HEA in 2024 are listed in Table 60 below.

The gross savings at the generator were estimated by using residential line loss factors of 1.0947 and 1.146601 for energy and peak demand savings respectively. The residential line loss factors correspond to the values submitted to the NSUARB as part of the 2014 Cost of Service Study Progress Update.<sup>60</sup> Residential line loss factors were used for all participants since municipal rate codes only represent a very small portion of participants (less than 1%).

<sup>60</sup> Nova Scotia Utility and Review Board, Matter M06555, 2014 Cost of Service Study Progress Update, Exhibit N-2.09, Appendix I1.

**Table 60: Evaluated 2024 HEA Gross Energy and Peak Demand Savings**

| Measure Category                                                                                                                                                                                                                                                      | HOT2000 Modelled Measures* | Wood Burning Equipment | HPWHs  | Electrical Thermal Storage | Energy Efficiency Measure Subtotal | Solar PV Measures | Total     |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------|------------------------|--------|----------------------------|------------------------------------|-------------------|-----------|
| Number of Participants**                                                                                                                                                                                                                                              | 4,417                      | 90                     | 53     | 1                          | -                                  | 2,276             | 5,367     |
| Total Installed Capacity (kW)                                                                                                                                                                                                                                         | -                          | -                      | -      | -                          | -                                  | 24,117            |           |
| <b>Evaluated Energy Savings</b>                                                                                                                                                                                                                                       |                            |                        |        |                            |                                    |                   |           |
| Unitary Energy Savings (kWh per KW installed)                                                                                                                                                                                                                         | -                          | -                      | -      | -                          | -                                  | 1,086             | -         |
| Gross Energy Savings Without Adjustment Ratio (AR) – at the Meter (GWh)                                                                                                                                                                                               | 14.062                     | 0.097                  | 0.068  | -                          | -                                  | 26.191            | 40.419    |
| 2024 Supplemental File Energy Savings (kWh)                                                                                                                                                                                                                           | -                          | -                      | -      | -                          | 0.044                              | 0.011             | 0.055     |

## 23.3 Net Savings

The Evaluator determined net energy and peak demand savings, that is the electrical energy and peak demand savings that can be reliably attributed to a program component, by estimating the net-to-gross ratio (NTGR). In the case of HEA, the NTGR is established considering the effects, namely free-ridership and participant spillover, which positively or negatively affect energy savings.

In addition to the NTGR, unconverted D assessment spillover savings as well as savings deductions for participation in other residential programs are also accounted for in the net savings calculation.

### 23.3.1 Free-ridership

For HEA, free-ridership occurs when participants would have implemented energy efficiency measures and/or solar PV systems in the absence of the program component.

Free-ridership was assessed in 2023 through a participant survey with HEA participants. Since no data-collection activities aimed at updating the free-ridership levels were conducted in 2024, the 2023 levels were used for the 2024 evaluation.

Table 62 outlines the free-ridership levels used for HEA for 2024 along with the survey parameters.

**Table 62: 2024 HEA Free-ridership Levels**

| Measure                    | Average Free-ridership Level | Sample Size | Population Size | Margin of Error |
|----------------------------|------------------------------|-------------|-----------------|-----------------|
| Energy Efficiency Measures | 17%                          | 77          | 3,995           | 4.20%           |
| Solar PV Measures          | 26%                          | 29          | 1,520           | 6.50%           |

<sup>61</sup> At the time of writing, 2023 data were not yet available. The Nova Scotia-specific factor was obtained from Nova Scotia Power's 2022 total system emissions data (5,770,500 CO2 eq tonnes) and total electricity generation (10,456 GWh) was drawn from the following two sources: Nova Scotia Power, Total System Emissions, <https://www.nspower.ca/clean-energy/air-emissions-reporting> (last accessed December 1, 2023), Emera inc., Management's Discussion & Analysis, as at February 23, 2023 [https://s25.q4cdn.com/978989322/files/doc\\_financials/2022/q4/Emera-Q4-2022-MD-A-FINAL-Feb-22%2723.pdf](https://s25.q4cdn.com/978989322/files/doc_financials/2022/q4/Emera-Q4-2022-MD-A-FINAL-Feb-22%2723.pdf) (last accessed December 1, 2023).

### 23.3.2 Participant Spillover

For HEA, participant spillover occurs when participants implement additional measures recommended in their initial energy assessments after their participation in the program component, that is after having completed the final energy assessment and due to the influence of having participated in the program component without receiving any additional support from the program component.

Similarly to free-ridership, no data collection aimed at updating the 2023 participant spillover level was conducted in 2024. Therefore, the 2023 spillover level was used as part of the 2024 evaluation for all measures.

Table 63 outlines the participant spillover level measured for HEA.

**Table 63: 2024 HEA Participant Spillover Level**

| Measure      | Number of Participants Generating Spillover | Average Participant Spillover Level |
|--------------|---------------------------------------------|-------------------------------------|
| All Measures | 11                                          | 1%                                  |

### 23.3.3 Net-to gross Ratio Calculation

The NTGR is calculated using the following equation.

$$NTGR = (1 - \% \text{ Free-ridership} + \% \text{ Participant Spillover})$$

The NTGR values calculated with the free-ridership and spillover levels established for HEA are presented in Table 64.

**Table 64: 2024 HEA NTGR Values**

| Measure                    | Free-ridership | Participant Spillover | NTGR |
|----------------------------|----------------|-----------------------|------|
| Energy Efficiency Measures | 17%            | 1%                    | 0.84 |
| Solar PV Measures          | 26%            |                       | 0.75 |

### 23.3.4 Unconverted Assessment Spillover

The unconverted D assessment savings spillover effect corresponds to the savings associated with those measures implemented by electrical participants who did not complete an E assessment by the end of the allocated 12-month period (referred to as expired participants or unconverted D assessment participants). It should be noted that only expired participants who use electricity as their primary heating source are considered in the analysis.

As part of the 2024 HEA evaluation, the Evaluator conducted a survey with expired participants and site visits to reassess unconverted D assessment savings parameters. The parameters used for tracked savings were based on data-collection activities conducted by E1 in 2014 and 2015. A similar approach was used by the Evaluator for the reassessment.

- › The proportion of participants who implemented at least one upgrade, measured through the expired participant survey results, remained the same as the tracked value, i.e. 54%. Of the 338 survey respondents, 183 declared having implemented at least one upgrade recommended in their home energy report.
- › The average savings value influenced by E1 was established at 2,097 kWh based on the results of 19 on-site visits. Site visits were conducted among expired survey respondents who declared having installed at least one measure. EAs went to their house to perform an E assessment and complete the final HOT2000 simulation model. Using the simulation models, the Evaluator calculated the savings for the 19 expired participants and multiplied the value with the E1 influence level declared by those participants during the survey. The tracked value was of 2,283 kWh. It should be noted that the new savings calculation methodology was used to establish the 2,097 kWh value. If the former methodology had been used, the average savings value would have been very close to the tracked value, i.e. 2,123 kWh.

Table 65 below outlines the tracked and evaluated parameters used to establish the unconverted D assessment spillover level for 2024. A total of 1,868 unconverted D assessment participants who use electricity as their primary heating source were included in the 2024 tracking sheet. Total unconverted D assessment spillover savings were calculated by multiplying the number of unconverted D assessment participants by both the proportion of participants who completed at least one upgrade and the associated savings.

**Table 65: 2024 HEA Unconverted D Assessment Spillover Savings**

| Parameters                                                                                        | Tracked Values | Evaluated Values |
|---------------------------------------------------------------------------------------------------|----------------|------------------|
| <b>Total Number of Unconverted D Assessment Participants</b>                                      | <b>1,868</b>   |                  |
| Ratio of Unconverted D Assessment Participants Who Implemented at Least One Measure               | 54%            | 54%              |
| <b>Total Number of Unconverted D Assessment Participants Who Implemented At Least One Measure</b> | <b>1,009</b>   | <b>1,009</b>     |
| Average Electrical Savings per Participant in kWh (with influence from E1)                        | 2,283          | 2,097            |
| <b>Total Unconverted D Assessment Spillover Energy Savings – at the Meter (GWh)</b>               | <b>2.303</b>   | <b>2.115</b>     |
| Demand-to-energy Ratio (MW/GWh)                                                                   | 0.283          |                  |
| <b>Total Unconverted D Assessment Spillover Peak Demand Savings – at the Meter (MW)</b>           | <b>0.652</b>   | <b>0.599</b>     |

Unconverted D assessment spillover reversals are expired participants from previous years and for which savings had been claimed and who ended up participating in HEA by completing their E assessment after the allocated 12-month period. To avoid double counting savings, the savings that were attributed to them as unconverted D assessment spillover in previous years are reversed, meaning they are deducted from total net savings.

In previous evaluations, these savings were deducted by simply subtracting the number of participants who ended participation in HEA from the number of unconverted D assessment spillover participants. Starting in 2024, reversals are calculated separately considering the change in savings parameters.

A total of 337 unconverted D assessment spillover reversal participants were identified in the tracking sheet for 2024. Their associated deductions are calculated in Table 66 based on the savings parameters used when they were initially claimed.

**Table 66: 2024 HEA Unconverted D Assessment Spillover Reversals**

| Parameters                                                                                                                                                                                           | Values         |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------|
| <b>Total Number of Unconverted D Assessment Spillover Reversals</b>                                                                                                                                  | <b>337</b>     |
| Ratio of Unconverted D Assessment Participants Who Implemented at Least One Measure                                                                                                                  | 54%            |
| Average Electrical Savings per Participant in kWh (with influence from E1)                                                                                                                           | (2,283)*       |
| <b>Total Unconverted D Assessment Spillover Reversal Energy Savings – at the Meter (GWh)</b>                                                                                                         | <b>(0.415)</b> |
| Demand-to-energy Ratio (MW/GWh)                                                                                                                                                                      | 0.283          |
| <b>Total Unconverted D Assessment Spillover Reversal Peak Demand Savings – at the Meter (MW)</b>                                                                                                     | <b>(0.118)</b> |
| *To determine the savings to be deducted for reversals, the parameters need to correspond to those used in previous years when they were claimed as unconverted D assessment spillover participants. |                |

Unconverted D assessment spillover savings are presented in energy units rather than as a percentage of annual gross savings. They are added to gross savings minus the reversal savings to be deducted.

### 23.3.5 Savings Deductions for Participation in Other Residential Programs

Several measures are offered under both HEA and Green Heat. In addition, Efficient Product Installation (EPI) introduced air sealing measures in 2019, and Solar Homes offers solar PV. To ensure that energy savings are not claimed twice for the same upgrade, the net electrical savings that were already claimed under Green Heat or EPI are deducted from HEA net electrical savings for those participants who participated in HEA and Green Heat or EPI during the same period. In addition, when approving HEA project files, E1 removes solar PV savings that were already claimed in Solar Homes during the same period.

Customer IDs are not used uniformly in the different tracking sheets to easily identify participation overlaps. To identify participants who participated in HEA and Green Heat or EPI during the same period, E1 created a tool that uses various customer information fields to find matches in the relevant tracking sheets. The Evaluator considers that the tool developed by E1 allows identifying most overlaps, which are rare since delays with Natural Resources Canada (NRCAN) are resolved and E1 is able to intercept overlaps between HEA and Green Heat prior to finalizing the participation process in Green Heat.

**Table 67: 2024 Savings Overlap to Deduct from HEA**

| Overlap                 | Net Energy Savings at Generator (GWh) | Net Peak Demand Savings at Generator (MW) |
|-------------------------|---------------------------------------|-------------------------------------------|
| Overlap with Green Heat | (0.013)                               | (0.007)                                   |
| Overlap with EPI        | (0.051)                               | (0.009)                                   |
| <b>Total</b>            | <b>(0.064)</b>                        | <b>(0.017)</b>                            |

### 23.3.6 Evaluated Net Savings

Net savings are defined as the energy use reductions specifically attributable to HEA. Net savings were calculated by applying the NTGR value, adding unconverted D assessment spillover savings, and subtracting Green Heat and EPI savings, as illustrated in the following equation.

$$\text{Net Savings} = \text{Gross Savings} \times \text{NTGR} + \text{Unconverted D Assessment Spillover Savings} - \text{Green Heat Net Savings Deductions} - \text{EPI Net Savings Deductions}$$

The detailed net savings results are presented in Table 68 below. The net electrical energy savings resulted in 15,093 tonnes of CO2 eq in net annual GHG emission reductions.

**Table 68: Evaluated 2024 HEA Net Energy and Peak Demand Savings**

|                                                                                   | Energy Efficiency Measures | Solar PV Measures | Total   |
|-----------------------------------------------------------------------------------|----------------------------|-------------------|---------|
| <b>Energy Savings</b>                                                             |                            |                   |         |

| <b>Net Peak Demand Savings Without Savings Deductions – at the Generator (MW)</b> | 8.697                      | -                 | 8.697   |
| Green Heat and EPI Net Peak Demand Savings Deductions (MW)                        | (0.017)                    | -                 | (0.017) |
| <b>Net Peak Demand Savings – at the Generator (MW)</b>                            | 8.681                      | -                 | 8.681   |

As outlined in Figure 51 below, HEA surpassed its targets by 68% and 81% for energy and peak demand savings respectively.

Figure 51: 2024 HEA Targets and Evaluated Savings

## 23.4 Realization Rate

Table 69 below compares the electrical energy and peak demand savings established through this evaluation to those calculated in the 2024 tracking sheet. It also includes the realization rate, representing the ratio of evaluated net savings to tracked net savings, for both energy savings and peak demand savings.

Table 69: Comparison of 2024 HEA Tracked and Evaluated Savings at the Generator

|                                                                                                                                                                                                                                                                                                                                                                     | Gross Savings |      | NTGR* | Net Savings |      | Realization Rate |

| Evaluation Results                                                                                                                                                                                                                                                                                                                                                  | 38.984        | GWh  | 0.82  | 31.962      | GWh  |                  |
| Peak Demand Savings                                                                                                                                                                                                                                                                                                                                                 |               |      |       |             |      |                  |
| Tracked Savings by E1                                                                                                                                                                                                                                                                                                                                               | 10.518        | MW   | 0.51  | 5.367       | MW   | 162%             |
| Evaluation Results                                                                                                                                                                                                                                                                                                                                                  | 9.698         | MW   | 0.90  | 8.681       | MW   |                  |
| *NTGR values in this table include the impacts of unconverted D assessment spillover savings as well as Green Heat and EPI savings deductions. The NTGRs presented in this table correspond to the rounded averages obtained by dividing net savings by gross savings, which explains why the NTGR values are different from those presented in the above sections. |               |      |       |             |      |                  |

The net evaluated electrical energy and peak demand savings determined by the Evaluator were higher than the net results tracked by E1. The differences between the tracked and evaluated savings are due to the change in the savings calculation methodology and the new adjustment ratios. In their tracked savings, E1 applied an anticipated billing analysis adjustment ratio of 0.54 in addition to the overestimation ratio. These two ratios combined reduce the savings more than the adjustment ratios established with the billing analysis as part of this evaluation. This explains the realization rates above 100%. Moreover, because peak demand savings are calculated separately for mini-split heat pumps and not impacted by the adjustment ratios, and E1 applied their 0.54 ratio to all peak demand savings, the realization rate for peak demand savings is much higher. It should be noted that solar PV, which accounts for 74% of HEA savings, has the same tracked and evaluated savings.

## 24 HEA Key Findings and Recommendations

As mentioned previously, the main objectives of the 2024 HEA evaluation were as follows:

- › Calculate gross and net results, namely electrical first-year and lifetime energy savings, peak demand savings, as well as avoided GHG emissions

This section provides the Evaluator's key findings in relation to the above objectives.

### **2024 HEA-Finding: Both HEA net electrical energy and demand savings exceeded targets.**

HEA achieved 31.962 GWh in net electrical energy savings and 8.681 MW in net peak demand savings at the generator in 2024, thus exceeding the planned net electrical energy savings of 19.012 GWh and the planned net peak demand savings of 4.799 MW.

### **2024 HEA-Finding: The increase in participation and sustained average gross savings per home observed since the introduction of the CGH Grant continued in 2024.**

With 5,367 projects, the 2024 participation level was the highest observed for HEA since the program component was launched. The average gross energy savings per home was 7,264 kWh, a slight decrease of 3% compared to 2023, which was the highest observed for HEA since the program component has been offered to both electrically and non-electrically heated homes. The integration of the CGH Grant into HEA contributed to the historically high participation rate and gross savings per participant seen in recent years. More specifically, one of the main contributors was the solar PV measures in the HEA offering, which constituted 74% of gross energy savings for 2024. Since the CGH Grant was closed to new applicants in the beginning of 2024, the Evaluator expects a decrease in HEA participation and gross savings in upcoming years.

### **2024 HEA-Finding: The evaluated energy and peak demand savings were higher than the savings tracked by E1.**

A new billing analysis was conducted as part of this evaluation and changes were made to the savings calculation approach to make it more robust. In anticipation of these changes, E1 applied an adjustment ratio of 0.54 to their tracked savings in addition to the overestimation ratios already applied to the modelled energy consumption values used to determine savings. This anticipated billing analysis adjustment ratio allowed E1 to track energy savings close to the evaluation results with a realization rate of 108%. As for peak demand savings, considering the billing analysis results did not impact the peak demand savings calculation for mini-split heat pumps, the realization rate is much higher, at 162%.

Unitary electrical energy and peak demand savings for wood and pellet stoves and fireplace inserts were also updated based on the Green Heat billing analysis results. Distinct unitary savings values were determined for stoves and fireplaces, with fireplaces having very low savings.

**Recommendation #1:** Consider removing wood fireplace inserts and pellet fireplace inserts from the HEA offer.

**2024 HEA-Finding: Parameters used to calculate unconverted D assessment spillover were reassessed and remain relatively stable.**

As part of the 2024 evaluation, the Evaluator compiled the results of 19 site visits completed by EAs among surveyed expired participants. The results were used to reassess the savings allocated to unconverted D assessment spillovers. The expired participant survey was also used to review the proportion of expired participants who implemented measures after their initial assessment. Even if the number of site visits completed is fairly low and did not meet the initial target (n=30), the Evaluator considers the results obtained consistent and sufficient for spillover assessment needs. If E1 desires a higher level of precision, they may consider conducting additional site visits as part of the 2025 evaluation process.

## 25 MHEEP Overview

This section describes the Mi'kmaw Home Energy Efficiency Project (MHEEP or the Project) program component, follows up on past evaluation recommendations, and provides an overview of MHEEP participation history.

### 25.1 MHEEP Description

MHEEP provides energy efficiency upgrades to homes in Mi'kmaw communities at no cost to participants or communities. E1 works with community housing managers (HMs), two delivery agents (DAs), and Mi'kmaw-preferred contractors to deliver the Project across all 13 Mi'kmaw communities in Nova Scotia. Figure 52 illustrates the participation process along with details about the program component.

**Figure 52: MHEEP Participation Process Summary**

MHEEP consists of conducting home energy assessments using the EnerGuide home evaluation framework, and each participating home receives an EnerGuide rating upon completion. The Project also provides building envelope upgrades such as draft-proofing and insulation as well as upgrades for space heating equipment, programmable and smart thermostats, and water heating equipment. Moisture management measures such as bathroom fans and heat recovery ventilators along with other measures such as carbon monoxide detectors may also be provided.

MHEEP also serves to identify opportunities to replace old appliances (dehumidifiers, refrigerators, and freezers) with energy efficient models and facilitates those replacements internally through the E1 Appliance Retirement program component. These measures are herein referred to as appliance replacements. Appliance Replacement was newly integrated into MHEEP reporting as of 2023, previously being included in Appliance Retirement reporting.

HMs identify and enroll participants and assist with program component requirements. DAs conduct pre-retrofit assessments (D assessments), recommend energy-saving measures, assign the work to contractors, and perform post-retrofit assessments (E assessments) to ensure that measures are implemented according to industry standards and that residents understand how to operate any new equipment.

MHEEP was launched in June 2018 as the First Nations Home Energy Efficiency Pilot. After the pilot stage in early 2019, MHEEP began work in participating homes in June 2019 and communications materials were developed to better inform HMs and participants. As of early 2024, privately owned homes are also eligible under amended eligibility criteria.

MHEEP funding comes from two sources: (1) Electricity ratepayer DSM funding is used for standard upgrades that reduce electricity consumption; and (2) funding from the Province of Nova Scotia (PNS) is used for upgrades that reduce non-electrical fuel consumption as well as a portion of upgrades that reduce electricity consumption. In 2023, a third type of allocation called non-standard was introduced; it is considered non-standard because all savings (electrical and non-electrical) from this type of participant are attributed entirely to PNS funding. This report presents all electrical savings achieved by MHEEP, including standard allocation, and attributed to DSM funding.

MHEEP was aimed at achieving 0.618 GWh in net electrical energy savings and 0.167 MW in net peak demand savings at the generator in 2024.

## 25.2 Follow-up on Past Evaluation Report Recommendations

No recommendations were made for MHEEP in the 2023 evaluation.

## 25.3 Participation History

As presented in Figure 16 below, 192 participants completed projects and achieved electrical energy savings under MHEEP in 2024, representing a 19% increase in participation compared to 2023 and the highest participation level since MHEEP inception. The figure also illustrates a 41% decrease in average gross energy savings per participant compared to 2023, which was mainly due to the updated adjustment ratios for modelled savings that resulted from the HEA billing analysis.

**Figure 53: Overview of MHEEP Participation, 2019-2024**

In addition to home retrofit projects completed through MHEEP, four old appliances (1 refrigerator, 2 freezers, and 1 dehumidifier) were replaced in 2024 through the program component.

Figure 54 below provides an overview of the evolution of MHEEP gross electrical energy and peak demand savings from 2019 to 2024. Total 2024 MHEEP gross energy savings were lower than in 2023 mainly due to the lower adjustment ratios. Since the new adjustment ratios had only a limited impact on peak demand savings, MHEEP total 2024 gross peak demand savings were higher than in 2023 because of the higher participation level and an updated unitary savings value.

**Figure 54: Evolution of MHEEP Gross Savings, 2019-2024**

## 26 MHEEP Evaluation Approach

The 2024 MHEEP evaluation comprised a condensed impact evaluation. The main objectives of the 2024 MHEEP evaluation were as follows:

- › Calculate gross and net MHEEP results, namely electrical first-year and lifetime energy savings, peak demand savings, as well as avoided GHG emissions.

Table 70 outlines the evaluation objectives and maps them to the research questions and methods established by the Evaluator. Each method is described further below.

**Table 70: 2024 MHEEP Evaluation Approach**

| Evaluation Objectives   | Research Questions                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Methodology                                                                                                                                                                             |

### Tracking Sheet Audit

Prior to performing the savings review, the Evaluator performed an audit of the final 2024 tracking sheet to ensure it was complete and the entered data were consistent. The detailed protocol used for the tracking sheet audit and the results obtained are presented in Appendix XXXIV.

### Unitary Savings Review

A unitary savings review was conducted for all measures (excluding the savings estimates obtained from HOT2000 and for MSHPs whose savings relied on the billing analysis) as part of a major update to the 2024-2025 Demand-Side Management Measure Assessment (DSM MA).<sup>62</sup> The unitary savings review entailed a literature review of technical reference manuals, metering studies, and program evaluations to determine if there were more appropriate<sup>63</sup> methodologies or parameters to be applied to calculate energy and peak demand unitary savings, including elements such as baseline assumptions, operating hours, efficiency levels, peak demand-to-energy ratios, and interactive effect factors.

<sup>62</sup> The 2024-2025 DSM MA is a reference document that provides an in-depth review of all parameters necessary to calculate the annual and lifetime gross energy and peak demand savings of most prescriptive measures and some semi-prescriptive measures offered through E1's DSM program portfolio. In addition, the Measure Assessment includes effective useful life values for all measures offered in E1's program portfolio. For the evaluations conducted during the last two years of the 2023-2025 DSM cycle, the Evaluator refers to the values presented in the 2024-2025 DSM MA.

<sup>63</sup> The Evaluator will judge whether new studies are more appropriate based on various factors, including but not limited by the following: The similarities between the measures implemented in a given study and E1's measures, the similarities in terms of climate or market conditions, the size of the sample studied, whether a study is recent, the quality of the study methodology, etc.

## EUL Update

In 2024, the Evaluator conducted a review of all EUL values as part of the 2024-2025 DSM MA update to determine if there were more appropriate EUL estimates.

## Calculations Using Evaluation Results

Building on all the above methods and collected data, the Evaluator calculated the first-year and lifetime energy and peak demand savings using the equations and parameters that were determined to be valid based on the current evaluation.

## GHG Emission Reduction Calculations

To obtain net avoided GHG emissions in CO<sub>2</sub> eq for MHEEP, the Evaluator multiplied the net energy savings by the latest Nova Scotia-specific factor for GHG emissions generated by electricity production. This factor was established using Nova Scotia Power (NS Power) data.

## 27 MHEEP Impact Evaluation

The objectives of the 2024 MHEEP condensed impact evaluation were to determine gross and net electrical energy and peak demand savings, annually avoided GHG emissions, as well as EUL values and associated lifetime energy savings. While the measures installed under MHEEP generate both electrical and non-electrical energy savings, only the standard-allocation electrical portion is covered in this report.

### 27.1 Tracking Sheet Audit

To ensure project results were reliably compiled, the Evaluator first performed a tracking sheet audit aimed at verifying the completeness and consistency of the data submitted by E1. The results obtained from the tracking sheet audit are presented in Appendix XXXIV. The tracked savings results presented in this report therefore refer to the corrected tracked savings obtained by the Evaluator.

### 27.2 Gross Savings

MHEEP gross savings correspond to the change in energy consumption resulting from the measures implemented by participants regardless of why they participated.<sup>64</sup> In 2024, MHEEP participants received building envelope upgrades, space heating upgrades, and/or appliance replacements that generated electrical savings.

MHEEP gross savings are obtained through HOT2000 modelling with the exception of the following non-modelled measures for which gross savings are calculated using unitary savings values:

- › Replaced old appliances through Appliance Replacement (dehumidifiers, refrigerators, and freezers)
- › Programmable and smart thermostats
- › Drain water heat recovery systems (DWHRs)
- › Heat pump water heaters (HPWHs)

The methodologies used for evaluating gross savings are described in the following subsections.

---

<sup>64</sup> Definition adapted from: National Renewable Energy Laboratory, *The Uniform Methods Project Chapter 23: Estimating Net Savings: Common Practices*, September 2014, p. 3.

## 27.2.1 Electrical Energy Savings

For MHEEP, electrical energy savings are calculated based on HOT2000 simulation results adjusted with billing analysis results and unitary savings values for prescriptive measures, as shown in the equation below.

$$\begin{aligned} & \text{Gross Energy Savings (kWh)} \\ &= \left( \frac{(Total\ Energy_D(GJ) - Total\ Energy_E(GJ))}{0.0036\ GJ/kWh} \times \%_{Elec} - HPWH\ (kWh) - DWHR\ (kWh) \right) \\ & \times AR + Savings\ for\ Prescriptive\ Measures\ (kWh) \end{aligned}$$

Where:

- › *Total Energy<sub>D</sub>* and *Total Energy<sub>E</sub>* correspond to the modelled energy consumption levels respectively obtained in HOT2000 during the pre-retrofit (D) and post-retrofit (E) assessments. When modelled energy consumption levels were not available, the participant EnerGuide rating, which is a rating based on the modelled whole-home consumption, was used. Also, if the final E assessment consumption levels were not available, the projected final consumption levels were used.
- › *HPWH (kWh)* corresponds to the unitary savings value established for HPWHs.
- › *DWHR (kWh)* corresponds to the unitary savings value established for DWHRs.
- › *AR* corresponds to the adjustment ratio (AR) established through a billing analysis and used to adjust the savings obtained from the difference between the modelled electrical energy consumption during the D and E assessments. ARs vary according to different space heating system scenarios. ARs were drawn from billing analyses conducted in 2024 as part of the HEA evaluation.
- › *%<sub>Elec</sub>* corresponds to the percentage of electrical space heating estimated by the DA through the D assessment.
- › *Savings for Prescriptive Measures* are obtained by multiplying the prescriptive measures installed through MHEEP by their respective unitary electrical energy savings value.

### Measures Modelled in HOT2000

After the D and E assessments, the DAs model the house in the HOT2000 energy simulation software to obtain the initial and final EnerGuide ratings of that house. Energy consumption levels obtained from HOT2000 simulation results are used to determine the electrical energy savings for the modelled measures. They correspond to the reduction in consumption between the D and E assessments.

Since 2018, the methodology used to calculate tracked savings compares electrical space heating consumption levels, both of which being adjusted with an overestimation ratio (OR). The ORs were drawn from billing analyses conducted during the 2015 and 2018 HEA evaluations. The 2018 evaluation served to establish distinct ORs depending on the space heating system in place.

As part of the 2024 evaluation, the Evaluator made some changes to the current savings calculation methodology to simplify it and make it more robust. To do so, the Evaluator conducted a new billing analysis as part of the HEA 2024 evaluation. The Evaluator used the savings values obtained with billing data to develop adjustment ratios (ARs) that can be directly applied to the modelled savings estimates obtained from HOT2000 using whole-home consumption (not only space heating). The complete billing analysis methodology and results are presented in Appendix XXXI.

The ARs obtained through HEA billing analysis performed as part of the 2024 evaluation are presented in Table 54 below. They were determined separately for three heat pump scenarios, as was the case for ORs. The tracked ORs are also presented in the table for comparison. The values in parenthesis represent the ratios (1 – OR) that were multiplied with the D and E space heating consumption values when adjusting the consumption with the previous methodology. It is worth reminding that ARs are directly applied to the savings values obtained from the difference between the total initial and final consumption values.

**Table 71: 2024 MHEEP Adjustment Ratios**

| Scenario                                                                            | Tracked                    |                            | Evaluated |
|-------------------------------------------------------------------------------------|----------------------------|----------------------------|-----------|
|                                                                                     | OR <sub>D</sub> Assessment | OR <sub>E</sub> Assessment | AR        |
| A participant who registered <b>with</b> a heat pump                                | 0% (1.00)                  | 0% (1.00)                  | 1.24      |
| A participant who registered <b>without</b> a heat pump and who did not install one | 19% (0.81)                 | 19% (0.81)                 | 0.58      |
| A participant who registered <b>without</b> a heat pump and then had one installed  | 19% (0.81)                 | 0% (1.00)                  | 0.43      |

Participants with non-electrical space heating are eligible for the program component, meaning participants can generate both electrical and non-electrical savings. As indicated in the equation further above, the proportion of electrical savings for each participant is determined by multiplying total energy consumption by the proportion of space heating covered by electrical heating systems during the D assessment.

## Non-modelled Measures

Replaced appliances as well as programmable and smart thermostats are not modelled in HOT2000. Instead, resulting energy savings are calculated based on unitary energy savings values from the 2024-2025 DSM MA. That document provides a detailed description of inputs, references, and unitary savings calculations for non-modelled measures offered through MHEEP. Since the MA was updated in 2024, the unitary energy savings values of multiple measures were updated.

For HPWHs and DWHRs, even if modelled in HOT2000, savings from these measures are deducted from the modelled savings (according to their unitary savings value) before applying the AR to the remaining modelled savings. HPWH savings are then added up as a prescriptive measure, again, according to their unitary savings value. This approach avoids applying the AR on HPWH and DWHR savings considering these measures were not captured in the billing analysis due to their low installation rates. Also, this will facilitate future savings accounting in conjunction with E1's HPWH market transformation pilot.

Table 72 summarizes the tracked and evaluated unitary energy savings values for non-modelled MHEEP measures for which the unitary savings were changed in 2024.

**Table 72: Tracked and Evaluated 2024 MHEEP Unitary Energy Savings**

| Measure                                             | Tracked Savings [kWh/year] | Evaluated Savings [kWh/year] |
|-----------------------------------------------------|----------------------------|------------------------------|
| Smart Thermostats with Electric Resistance Baseline | 348                        | 312                          |
| Smart Thermostats with Heat Pump Baseline           | 514                        | 564                          |
| <b>Appliance Replacement</b>                        |                            |                              |
| Refrigerators                                       | 735                        | 674                          |
| Freezers                                            | 2,006                      | 1,380                        |
| Dehumidifiers                                       | 603                        | 616                          |

## 27.2.2 Peak Demand Savings

Peak demand savings correspond to the demand savings that coincide in time with the peak demand period of the electricity system. The projected electricity peak demand period in Nova Scotia is between 5 p.m. and 7 p.m. in the months of December to February on non-holiday weekdays.

For MHEEP, modelled peak demand savings were calculated based on electrical savings using a peak demand-to-energy ratio of 0.283 MW/GWh for space heating savings (RES-Elect Space Heat & Cool), as set by Navigant in the 2016-2018 DSM Plan. This ratio was established based on the modelled system coincident peak demand savings and energy savings for a projected deployment of measures. Navigant used local data to establish the ratio. The Evaluator considered that the approach used by Navigant to establish the peak demand-to-energy ratio was still valid and therefore used it to estimate peak demand savings.

An exception was made for heat pump measures. Starting in 2021, unitary peak demand savings were calculated separately for heat pump measures. As documented in the 2024-2025 DSM MA, heat pump peak demand savings were established by multiplying an average unitary peak demand savings per capacity, which was based on the savings of the heat pump measures installed under HEA and was updated from 0.129 W/(Btu/hr) to 0.148 W/(Btu/hr) in 2024, by the capacity of each system installed under MHEEP and the percentage of electrical space heating.

Replaced appliances, programmable and smart thermostats, drain water heat recovery systems, and heat pump water heaters are not modelled in HOT2000. Instead, peak demand savings are calculated based on unitary peak demand savings values. The detailed calculations for the unitary peak demand savings of each measure installed through MHEEP are presented in the 2024-2025 DSM MA. Since the Measure Assessment was updated in 2024, the unitary peak demand savings values of some measures were updated.

Table 73 summarizes the tracked and evaluated unitary peak demand savings values of measures for which the unitary peak demand savings were changed in 2024.

**Table 73: Tracked and Evaluated 2024 MHEEP Unitary Peak Demand Savings**

| Measure                      | Tracked Savings<br>[W/year] | Evaluated Savings<br>[W/year] |
|------------------------------|-----------------------------|-------------------------------|
| <b>Appliance Replacement</b> |                             |                               |
| Refrigerators                | 101                         | 93                            |
| Freezers                     | 277                         | 190                           |
| Dehumidifiers                | 202                         | 206                           |

## 27.2.3 Interactive Effects

In a home, interactive effects occur when the implementation of energy efficiency measures has an impact on the energy consumption of other elements such as heating and cooling. The interactive effects of the space heating measures modelled in HOT2000 were already considered in the savings calculations since the simulation models encompass the total energy consumption of a house.

For the 2024 evaluation, programmable and smart thermostats as well as drain water heat recovery systems and replaced old appliances were measures not modelled in HOT2000. As presented in the 2024-2025 Measure Assessment, they do not have an impact on the energy consumption of other elements to be considered.

## 27.2.4 Effective Useful Life

As part of the 2024-2025 DSM MA activities, the Evaluator reviewed the EUL values used in the calculation of electrical energy savings that are expected to persist over time. The EUL values for building envelope upgrades and space heating equipment, i.e. the modelled savings, are based on the measures installed by HEA participants since HEA and MHEEP participants install similar measures. As part of the 2024-2025 DSM MA update, the EUL values were not revised for any measure categories except for heat pump water heaters and modelled measures. Table 74 presents the EUL values that were changed in 2024.

**Table 74: Tracked and Evaluated 2024 MHEEP Equivalent EUL Values**

| Measure                            | Tracked Equivalent EUL [years] | Evaluated Equivalent EUL [years] |
|------------------------------------|--------------------------------|----------------------------------|
| Heat Pump Water Heaters            | 10                             | 15                               |
| Building Envelope (Modelled)       | 20.8                           | 20.5                             |
| Space Heating Equipment (Modelled) | 20.8                           | 20.5                             |

## 27.2.5 Evaluated Gross Savings

The modelled and non-modelled measure annual gross savings at the meter are presented in Table 75 and Table 76 below respectively. Table 77 further below combines the savings of all MHEEP measures and presents total MHEEP annual gross savings.

**Table 75: Evaluated 2024 MHEEP Modelled Measure Gross Energy and Peak Demand Savings**

|                                                                                                                                                                                                                                                                                                                                                                        | Total        |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------|

| <b>Gross Peak Demand Savings – at the Meter (MW)</b>                                                                                                                                                                                                                                                                                                                   | <b>0.419</b> |
| * Corresponds to the equivalent peak demand-to-energy ratio obtained by dividing gross peak demand savings by gross energy savings. This value is different from the peak demand-to-energy ratio that was formerly used (0.283 MW/GWh) because of the different calculation methodology applied for heat pumps and the addition of non-modelled prescriptive measures. |              |

| * Only measures with at least one installed unit are included in this table. |                                   |                                       |                                  |                                       |              |

As presented in Table 76 above, appliances replaced through Appliance Replacement (refrigerator, freezer, and dehumidifier replacements) resulted in gross energy savings of 0.004 GWh and gross peak demand savings of 0.0007 MW.

The gross savings at the generator were estimated by using a line loss factor of 1.0947 for energy savings and 1.1466 for peak demand savings between the meter and the generator. These line loss factors were provided by NS Power and correspond to the values used for residential consumers. The line loss factors correspond to the values submitted to the Nova Scotia Utility and Review Board (NSUARB) as part of the 2014 Cost of Service Study Progress Update.<sup>65</sup>

With total gross energy and lifetime energy savings of 0.401 GWh and 8.141 GWh respectively, the average EUL value for MHEEP was 20.3 years in 2024.

<sup>65</sup> Nova Scotia Utility and Review Board, Matter M06555, 2014 Cost of Service Study Progress Update, Exhibit N-2.09, Appendix I1.

**Table 77: Evaluated 2024 MHEEP Gross Energy and Peak Demand Savings**

| Measure Category                                                                                                                                                              | Modelled     | Non-modelled | Total        |

As presented in Table 78, GHG emission reductions were calculated by applying the Nova Scotia-specific factor<sup>66</sup> for GHG emissions generated by electricity production to MHEEP gross savings results.

**Table 78: Evaluated 2024 MHEEP Gross GHG Emission Reductions**

|                                                                                             | Total        |

## 27.3 Net Savings

The Evaluator determined the net energy and peak demand savings, i.e. the electrical energy and peak demand savings that can be reliably attributed to a program component, by estimating a net-to-gross ratio (NTGR). More precisely, the NTGR represents the positive or negative impacts of spillover and free-rider effects on gross savings. A NTGR of 1.00 was used since participating homes are owned by Mi'kmaw communities that traditionally have small housing budgets spread across many competing housing priorities.

<sup>66</sup> At the time of writing, 2024 data were not yet available. The Nova Scotia-specific factor was obtained from Nova Scotia Power's 2023 total system emissions data (4,931,152 CO2 eq tonnes) and total electricity generation (10,442 GWh) was drawn from the following two sources: Nova Scotia Power, Total System Emissions, <https://www.nspower.ca/clean-energy/air-emissions-reporting> (last accessed September 27, 2024) and Emera Inc., Emera Inc. 2023 Annual Report, p. 31, available at [https://s25.q4cdn.com/978989322/files/doc\\_financials/2023/ar/Emera\\_2023\\_AR\\_FINAL.pdf](https://s25.q4cdn.com/978989322/files/doc_financials/2023/ar/Emera_2023_AR_FINAL.pdf) (last accessed September 27, 2024).

### 27.3.1 Evaluated Net Savings

Net savings are defined as the energy savings specifically attributable to MHEEP. Since spillover and free-ridership effects were considered nil, the net MHEEP impacts are equal to the gross savings generated by the program component. Overall, total net energy and peak demand savings amounted to 0.401 GWh and 0.481 MW at the generator respectively. Likewise, the net annual GHG emission reductions are equal to the gross annual GHG emission reductions.

As outlined in Figure 55, MHEEP fell short of its electrical energy savings target by 35% and exceeded its peak demand savings target by 189%.

**Figure 55: 2024 MHEEP Targets and Evaluated Savings**

### 27.4 Realization Rate

A comparison of the gross and net energy and peak demand savings values established through this evaluation and those tracked by E1 is presented in Table 79 below. The table also includes the realization rate, representing the ratio of evaluated net savings to tracked net savings, for both energy savings and peak demand savings.

**Table 79: Comparison of Tracked and Evaluated 2024 MHEEP Savings at the Generator**

|                                                                                                                                                                  | Gross Savings |      | NTGR | Net Savings |      | Realization Rate |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|------|------|-------------|------|------------------|
|                                                                                                                                                                  | Value         | Unit |      | Value       | Unit |                  |
| Energy Savings                                                                                                                                                   |               |      |      |             |      |                  |
| Tracked Savings by E1                                                                                                                                            | 0.578         | GWh  | 1.00 | 0.578       | GWh  | 69%              |
| Evaluation Results                                                                                                                                               | 0.401         | GWh  | 1.00 | 0.401       | GWh  |                  |
| Peak Demand Savings                                                                                                                                              |               |      |      |             |      |                  |
| Tracked Savings by E1                                                                                                                                            | 0.420         | MW   | 1.00 | 0.420       | MW   | 115%             |
| Evaluation Results                                                                                                                                               | 0.481         | MW   | 1.00 | 0.481       | MW   |                  |
| *NTGRs varied for each product category. The NTGRs presented in this table correspond to the rounded averages obtained by dividing net savings by gross savings. |               |      |      |             |      |                  |

The evaluated net energy savings were 31% lower than the values tracked by E1 mainly due to the updated adjustment ratios. Conversely, the evaluated net peak demand savings were 15% higher than the values tracked by E1 due to the updated peak demand savings per capacity value for heat pumps.

## 28 MHEEP Key Findings and Recommendations

As mentioned previously, the main objectives of the 2024 MHEEP evaluation were as follows:

- › Calculate gross and net MHEEP results, namely electrical first-year and lifetime energy savings, peak demand savings, as well as avoided GHG emissions

This section provides the Evaluator's key findings in relation to the above objectives. The Evaluator has no specific recommendation for MHEEP.

### **2024 MHEEP-Finding: MHEEP net electrical energy savings fell short of targets while peak demand savings exceeded targets.**

MHEEP achieved 0.401 GWh in net electrical energy savings and 0.481 MW in net peak demand savings at the generator in 2024, thus not attaining the planned net electrical energy savings of 0.618 GWh while exceeding the planned net peak demand savings of 0.167 MW. MHEEP achieved 65% of the electrical energy savings target in 2024 compared to 95% in 2023. Although the participation level was higher, it was not sufficient to reach the energy savings target.

### **2024 MHEEP-Finding: While MHEEP achieved the highest participation level since its inception, the average savings per participant decreased in 2024, generating lower energy savings and higher peak demand savings in 2024 compared to 2023 levels.**

Compared to 2023 levels, participation increased by 19%, reaching the highest participation levels since the inception of the program component, and the average savings per participant decreased by 41% mainly due to the updated adjustment ratios. Overall, these changes resulted in a decrease in total electrical energy savings of 31% and in an increase in peak demand savings of 29% in 2024 compared 2023 levels, the new adjustment ratios having a limited impact on peak demand savings.

### **2024 MHEEP-Finding: The evaluated net energy and peak demand savings determined by the Evaluator were respectively lower and higher than the initial net savings tracked by E1.**

The evaluated net energy and peak demand savings were 31% lower and 15% higher than the values tracked by E1 respectively. This was mainly due to revisions to the adjustment ratios and peak demand savings per capacity value for heat pumps.

## 29 Residential Behaviour Overview

This section describes the Residential Behaviour program component, follows up on past evaluation recommendations, and provides an overview of participation history.

### 29.1 Description

The Residential Behaviour program component, publicly branded as Efficiency Insights, is designed to help Nova Scotia Power (NS Power) residential customers reduce their electricity consumption. The component provides a subset of customers with detailed usage data allowing them to compare their energy use with similar homes and includes behaviour change tips and recommendations for Efficiency Nova Scotia (ENS) programs to encourage the adoption of energy-conscious habits and practices.

E1's service provider, Bidgely, processes NS Power data using proprietary algorithms to create personalized Home Energy Reports (HERs) in both paper and electronic formats. E1 integrates its Efficiency Insights tools into NS Power's MyEnergy Insights (MEI) platform to ensure a seamless experience for customers. Customers are encouraged to use the MEI online portal to complete a survey about energy use in their home, the results of which help improve HER personalization.

To enhance customer engagement, E1 employs Energy Solutions Advisors (ESAs) who assist customers in understanding and applying insights from their HERs and the MEI platform. They also guide customers toward suitable ENS programs.

The program component is funded under E1's 2023-2025 Demand-side Management Plan. ENS previously delivered a similar initiative, known as the Home Energy Report program, from 2013 to 2015.

Energy savings are assessed annually through a billing analysis that serves to compare the energy usage of program participants with a control group not enrolled in the program. E1 treatment customers will receive up to six reports per year, aligned with NS Power's bi-monthly billing cycles. Since the program component was launched in May 2024, four reports were issued in 2024. Reports are distributed continuously in weekly batches given the variability in customers' billing cycles. Additionally, two of the annual reports are seasonally tailored to reflect the heating and cooling seasons.

### 29.2 Follow-up on Past Evaluation Report Recommendations

There are no past recommendations since this is the first evaluation of Residential Behaviour.

### 29.3 Participation History

Residential Behaviour is an opt-out program component, which means that E1 enrolls customers, and customers remain in the program until they opt out online or by contacting E1.

The targeted population for Residential Behaviour is NS Power residential customers with rate codes 02B and 03B, which include most residential customers who had an active account and sufficient billing to constitute the baseline period. Prior to program launch, the Evaluator was mandated to identify eligible customers and randomly assign them to a control or treatment group. The population was split into three waves corresponding to high, medium, and low electricity users. Table 80 below presents the number of selected participants (treatment groups) and those selected to be in the control groups when the group selection was made in March 2024 and at the time of program launch in May 2024.

**Table 80: 2024 Treatment and Control Group Sizes**

| Wave                                             | Population Size (N) | Treatment Group Size | Control Group Size |
|--------------------------------------------------|---------------------|----------------------|--------------------|
| <b>Group Sizes at the Time of Selection</b>      |                     |                      |                    |
| 1 – High users                                   | 119,132             | 101,273              | 17,859             |
| 2 – Medium users                                 | 103,752             | 93,233               | 10,519             |
| 3 – Low users                                    | 95,403              | 66,708               | 28,695             |
| Total                                            | 318,287             | 261,214              | 57,073             |
| <b>Group Sizes at the Time of Program Launch</b> |                     |                      |                    |
| 1 – High users                                   | 114,596             | 97,368               | 17,228             |
| 2 – Medium users                                 | 98,409              | 88,482               | 9,927              |
| 3 – Low users                                    | 76,435              | 53,459               | 22,976             |
| Total                                            | 289,440             | 239,309              | 50,131             |

Over time, residential behaviour programs experience attrition, i.e. they lose customers in the study because of account closures or participants move. These are considered as inactive accounts. Moreover, in the case of E1 Residential Behaviour, customers who switch to a solar rate code due to the installation of solar photovoltaic systems are also removed from the study because they no longer offer a valid billing analysis comparison to non-solar customers. Together, these customer losses form the attrition rate. Customers do not receive **Efficiency Insights** reports after their accounts become inactive or they switch to solar.

This attrition explains why some participants were lost between the treatment and control group selection (March 2024) and program launch (May 2024). Then, during the first program year between May and December 2024, 13,439 treatment group accounts became inactive or switched to solar, which represent an overall attrition rate of 5.6%. Figure 56 below illustrates the percentages of initial treatment participants from May 2024 and who became inactive or switched to solar for each wave. The switch to the solar rate code is responsible for a large portion of the attrition rate.

**Figure 56: Proportion of Treatment Customers that Became Inactive or Switched to Solar**

During the period from May to December 2024, 3.5% of treatment participants also opted out of the program component, i.e. asked to stop receiving HERs or did not receive electronic or paper HERs because of an invalid address. The opt-out rate is similar in each wave.

## 30 Residential Behaviour Evaluation Approach

The 2024 Residential Behaviour evaluation consisted of a comprehensive impact evaluation using a billing analysis. The main objectives of the 2024 Residential Behaviour evaluation were as follows:

- › Calculate net results, namely electrical first-year energy savings, and avoided GHG emissions

The Evaluator identified key research questions aimed at achieving the above objectives. Table 81 outlines the evaluation objectives and maps them to the Evaluator's research questions and methods. Each method is described further below.

**Table 81: 2024 Residential Behaviour Evaluation Approach**

| Evaluation Objectives | Research Questions                                                                                                                                                                                                                                                                                                                                           | Methodology                                                                                                                                                               |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Calculate net results | <ul style="list-style-type: none"><li>› What are the evaluated first-year net electrical energy savings?</li><li>› Are the participation levels in other ENS residential programs significantly higher among treatment participants? If yes, what savings deductions should be made?</li><li>› What are the net GHG emission reductions in CO2 eq?</li></ul> | <ul style="list-style-type: none"><li>› Billing analysis</li><li>› Analysis of participation in other E1 programs</li><li>› GHG emission reduction calculations</li></ul> |

### Billing Analysis

A billing analysis including a comparison of the treatment and control group electricity consumption levels using a difference-in-difference approach was conducted to calculate net electrical energy savings.

### Analysis of Participation in Other Programs

The Evaluator compared the participation levels between the treatment and control groups in other residential program components offered by E1, namely Efficient Product Installation (EPI), Green Heat (GH) and Home Energy Assessment (HEA), to verify if higher participation levels are observed in those treatment groups and deduct savings to avoid double counting.

### GHG Emission Reduction Calculation

To obtain net avoided GHG emissions in CO2 eq for Residential Behaviour, the Evaluator multiplied the net energy savings by the latest Nova Scotia-specific factor for GHG emissions generated by electricity production. This factor was established using NS Power data.

### Note on Margin of Error

For evaluation activities that yield quantitative results based on a sample, the Evaluator aimed to achieve a maximum margin of error of 10% at a confidence level of 90%. This means that, if measurements were conducted many times with different samples, the data would be within 10 percentage points above or below the percentage reported 90% of the time. Thus, the margin of error indicates the relative level of precision<sup>67</sup> of a measurement, while its associated confidence level indicates the probability of a measurement falling within the margin of error.<sup>68</sup>

<sup>67</sup> Precision refers to how reproducible a set of measurements is. It does not take into account how close the measured values are to the true values since this would refer to accuracy.

<sup>68</sup> As part of this evaluation, confidence levels and margins of error only take random sampling errors into account; they do not reflect non-sampling errors or biases such as data entry errors, inaccurate responses from respondents, or the inability to contact certain people.

As part of the 2024 Residential Behaviour evaluation, the Evaluator calculated the margins of error for savings values obtained from the billing analysis. The margins of error are listed alongside results in the applicable sections below. They are calculated at a confidence level of 90%.

## 31 Residential Behaviour Impact Evaluation

The objectives of the 2024 Residential Behaviour impact evaluation were to determine net electrical energy savings.

The savings calculation methodology for Residential Behaviour is based on evaluation protocols commonly used in North America to assess savings resulting from residential behaviour programs, based on a randomized controlled trial (RCT) design,<sup>6970</sup> the Evaluator's experience in evaluating such programs, and industry best practices. A RCT is a program design through which households in a given population are randomly assigned to two groups – a treatment group and a control group – and the outcomes for the two groups are compared, resulting in unbiased program savings estimates. Residential Behaviour is based on a RCT design.

### 31.1 Tracking Sheet Audit

Considering Residential Behaviour relies on a random selection of treatment group participants among all residential customers, the program component does not have a tracking sheet. Therefore, no tracking sheet audit was conducted for this evaluation.

### 31.2 Net Savings

For Residential Behaviour, savings correspond to the change in electricity consumption resulting from behaviours adopted by treatment group participants compared with the change in electricity consumption observed among control group participants. Savings therefore already correspond to net savings that can be directly attributable to the program component. Indeed, by using a control group in the comparison, the savings already include program influence on participants' decisions. According to the Uniform Methods Project (UMP), net savings are defined by the difference in energy consumption with the program in place versus that consumption that would have occurred in the absence of the program.<sup>71</sup> Subtracting the energy consumption change that is not attributable to the program, as represented by the control group energy consumption change, from the treatment group energy consumption change provides a robust estimate of the net change in energy consumption directly attributed to the program. Therefore, no additional free-ridership or spillover effects need to be applied to the savings established by the comparison. The only additional consideration to be taken into account is if Residential Behaviour results in increased participation in other residential programs to avoid any double counting between ENS programs.

The following subsections describe the steps used to calculate program net savings.

#### 31.2.1 Treatment and Control Group Selection and Equivalency Check

To yield accurate and unbiased results when calculating savings under a RCT approach, the treatment and control groups must be selected properly so that the two groups are similar. For Residential Behaviour, the Evaluator was responsible for selecting the treatment and control groups to ensure they were randomly selected and confirm their equivalency prior to program launch.

<sup>71</sup> NREL (2020). Chapter 21: Estimating Net Savings – Common Practices, The Uniform Methods Project: Methods for Determining Energy Efficiency Savings for Specific Measures: September 2011 – August 2020.

The Evaluator received energy consumption data for all NS Power residential customers in rate codes 02B and 03B, which include most residential customers. The energy consumption data were directly provided by E1 after gathering advanced metering infrastructure (AMI) data aggregated on a monthly basis from the NS Power system. The Evaluator then analyzed the number of active accounts as well as the distribution of their consumption levels. As presented in Subsection 29.3 above, the population was split into three different waves corresponding to high, medium, and low electricity users. For each wave, the Evaluator randomly assigned customers in the treatment or control group. The proportions of treatment versus control group customers were determined by the Evaluator for each wave based on statistical tests in order to optimize the treatment group sizes while ensuring being able to detect savings.

To ensure that the selected groups were statistically equivalent, the Evaluator compared the pre-program energy consumption data and the geographical locations of the treatment and control groups of each wave.

Table 82 below presents the average daily consumption levels of households in the treatment and control groups for each wave during the pre-program period (May 2023 to April 2024) as well as the variation between both groups

**Table 82: Average Daily Electricity Consumption Values for the Pre-program Period**

| Wave             | Group     | Average Daily Consumption (kWh) | Variation Between Control and Treatment Groups |
|------------------|-----------|---------------------------------|------------------------------------------------|
| 1 – High users   | Control   | 46.2070                         | 0.08%                                          |
|                  | Treatment | 46.2437                         |                                                |
| 2 – Medium users | Control   | 24.8000                         | 0.25%                                          |
|                  | Treatment | 24.7379                         |                                                |
| 3 – Low users    | Control   | 11.6720                         | 0.31%                                          |
|                  | Treatment | 11.6361                         |                                                |

As outlined in Table 82 above, the difference in average daily electricity consumption between the control and treatment group for each wave is very minor. This analysis therefore confirms that the Evaluator properly selected households for the treatment and control groups based on electricity consumption data and that both groups demonstrate similar consumption patterns.

This analysis was performed using the AMI data for the pre-program period from May 2023 to April 2024. A similar analysis was conducted with 24 months (divided into year -1 and year 2) of bi-monthly billing data prior to program launch, where available, to ensure that no consumption patterns could be detected. Average daily consumption levels were found to be similar to those calculated in Table 82 and no major differences in consumption levels between year 1 and year 2 were detected. Table 83 compares the geographical locations of households selected in each group using postal codes provided by E1.

**Table 83: Distribution of Geographical Locations**

| Wave             | Region                           | Control | Treatment |
|------------------|----------------------------------|---------|-----------|
| 1 – High users   | Number of Accounts <sup>72</sup> | 17,228  | 97,368    |
|                  | HRM                              | 38.93%  | 38.99%    |
|                  | Cape Breton                      | 14.06%  | 14.14%    |
|                  | Rest of Mainland NS              | 47.01%  | 46.87%    |
| 2 – Medium users | Number of Accounts               | 9,967   | 88,482    |
|                  | HRM                              | 36.04%  | 35.60%    |
|                  | Cape Breton                      | 16.75%  | 16.85%    |
|                  | Rest of Mainland NS              | 47.21%  | 47.55%    |
| 3 – Low users    | Number of Accounts               | 22,976  | 53,459    |
|                  | HRM                              | 54.69%  | 55.67%    |
|                  | Cape Breton                      | 13.19%  | 13.28%    |
|                  | Rest of Mainland NS              | 32.12%  | 31.05%    |

The Evaluator conducted statistical tests to verify whether the small differences in home locations between the control and treatment groups were statistically significant. In all cases, the difference was found to be insignificant, thereby confirming that home locations were randomly assigned to the control and treatment groups.

### 31.2.2 Installation Rates

Considering a billing analysis is used to calculate Residential Behaviour savings, the savings already take into account installation rates. Therefore, no additional installation rates needed to be applied.

### 31.2.3 Energy Savings

The model used to calculate savings for Residential Behaviour is the difference-in-difference (DiD). The DiD serves to compare **the average change in electricity consumption** in the treatment group prior to and during program participation to the change in energy use in the control group for the same periods. The **pre-program period** consists of the 12-month period prior to program launch, i.e. **from May 2023 to April 2024**. The **post-program period** corresponds to any evaluation year after the program launch. For the 2024 evaluation, since the program component was launched in May 2024, the post-program period is **from May to December 2024**.

Using the DiD model, the Evaluator calculated both monthly savings and annual savings (or cumulative savings). The monthly savings approach makes it possible to see the trend in energy savings month by month. The cumulative approach serves to directly calculate the savings for the whole evaluation period. While the monthly savings approach presents savings estimates for each month of the year, it can lead to results that are not statistically significant for certain months of the year due to larger margins of error. For this reason, the Evaluator elected to use the cumulative approach for official program component reporting while also presenting monthly savings for indicative purposes.

<sup>72</sup> The numbers of customers indicated here differ from those indicated in Table 80 because of account closures and the use of filters to exclude outliers and customers with missing information.

## Data Preparation

Before calculating savings, the Evaluator cleaned and prepared the AMI data provided by E1.

The received AMI data contained consumption data aggregated on a monthly basis. The pre-program data cover the 12-month period prior to program launch, i.e. from May 2023 to April 2024. The post-program data for the 2024 evaluation period cover the months of May 2024 to December 2024 inclusively.

When developing the data preparation procedure, the Evaluator asked the service provider to share their data cleaning procedure to ensure that their criteria were consistent. The data preparation procedure applied by the Evaluator included the following actions:

- › Remove outlier data
- › Remove duplicate data
- › Remove customer accounts that became inactive from the month when they became inactive (the list of inactive accounts, essentially corresponding to customers having moved or who closed their account, was provided by the program implementer)
- › Remove customer accounts that were switched to solar rate codes from the month when the switch occurred

After applying these data preparation steps to each treatment and control group customer, 5.6% of customers were removed at some point during the evaluation period (corresponding to the attrition rate) and 0.6% of observations (monthly consumption data) were also removed.

It should be noted that treatment group customers who opted out or who did not receive electronic or paper HERs because of an invalid address or not being registered with the NS Power My Account were kept in the analysis to avoid unbalancing the treatment and control groups (since these situations only occur in the treatment group) and causing bias in the savings estimates. Keeping opted-out accounts is the recommended approach in behaviour program evaluation protocols. Conversely, inactive accounts or accounts that switched to solar could be removed from the analysis as they occur equally in both the treatment and control groups.

## Cumulative Savings

The DiD model serves to compare the difference in the average daily consumption between the treatment group and the control group before and after program participation. The cumulative approach uses the average daily consumption within the entire period. The Evaluator also calculated monthly savings to observe monthly trends, the details of which are presented in Appendix XXXVI. The equation used under the cumulative approach to calculate total savings is expressed as follows.

$$\begin{aligned} \text{Cumulative Savings} &= [(Post\_kWh_{Control} - Post\_kWh_{Treat}) - (Pre\_kWh_{Control} - Pre\_kWh_{Treat})] \\ &\times \sum_{i=1}^N Nb\_Days \end{aligned}$$

Where:

- ›  $Post\_kWh_{Control}$  = The control group's average daily consumption over the given post-program year
- ›  $Post\_kWh_{Treat}$  = The treatment group's average daily consumption over the given post-program year
- ›  $Pre\_kWh_{Control}$  = The control group's average daily consumption over the pre-program period
- ›  $Pre\_kWh_{Treat}$  = The treatment group's average daily consumption over the pre-program period
- ›  $\sum_{i=1}^N Nb\_Days$  = The total number of active treatment days in the given year of each participating household (i)

Since the number of participating households in the treatment group with available AMI data varies from month to month, the Evaluator needed to adjust the cumulative savings approach to properly account for this and obtain the total savings value. Instead of multiplying the average daily savings by the number of participating households as was done for the monthly approach, the average daily savings obtained using the cumulative approach are multiplied by the total number of treatment days of each participating household.

Table 84 presents the 2024 electrical savings values established by the Evaluator based on the cumulative approach. Cumulative savings are used for reporting annual evaluated savings.

**Table 84: 2024 Evaluated Cumulative Electrical Energy Savings**

| Parameters and Results                                  | Cumulative Savings |
|---------------------------------------------------------|--------------------|
| <b>Wave 1 – High users</b>                              |                    |
| Initial Number of Active Participants (Treatment Group) | 97,368             |
| Attrition Rate (%)                                      | 5.2%               |
| Total Number of Treatment Days*                         | 23,110,379         |
| Average Daily Consumption (Treatment kWh/day)           | 37.8               |
| Average Daily Savings (kWh/day)                         | 0.132              |
| Percentage of Savings (%)                               | 0.34%              |
| Margin or Error (%)                                     | 0.30%              |
| <b>Total Savings (GWh)</b>                              | <b>3.051</b>       |

| Parameters and Results                                                                                                                          | Cumulative Savings |
|-------------------------------------------------------------------------------------------------------------------------------------------------|--------------------|
| <b>Wave 2 – Medium users</b>                                                                                                                    |                    |
| Initial Number of Active Participants (Treatment Group)                                                                                         | 88,482             |
| Attrition Rate (%)                                                                                                                              | 5.2%               |
| Total Number of Treatment Days*                                                                                                                 | 21,017,949         |
| Average Daily Consumption (Treatment kWh/day)                                                                                                   | 21.8               |
| Average Daily Savings (kWh/day)                                                                                                                 | 0.135              |
| Percentage of Savings (%)                                                                                                                       | 0.62%              |
| Margin or Error (%)                                                                                                                             | 0.37%              |
| <b>Total Savings (GWh)</b>                                                                                                                      | <b>2.837</b>       |
| <b>Wave 3 – Low users</b>                                                                                                                       |                    |
| Initial Number of Active Participants (Treatment Group)                                                                                         | 53,459             |

| *Total number of treatment days is the sum-product of the number of active participants in each month by the number of days in the given month. |                    |

As mentioned at the beginning of Subsection 31.2.3 above, the savings obtained through the cumulative approach are used for official program component reporting because they are more inclusive of the monthly fluctuations in the margins of error that occur within a year. The sum of the savings calculated using the monthly approach differs from that obtained with the cumulative savings results because of the statistically insignificant savings for most months of the evaluation period. Interestingly, with the cumulative approach, savings values are similar for waves 1 and 2 mainly because the first months of wave 1 demonstrate very low savings and even negative savings in May. Wave 1 is expected to generate more savings in the upcoming months once the ramp-up period is passed.

### 31.2.4 Peak Demand Savings

No peak demand savings targets were set for Residential Behaviour and no peak demand savings were calculated as part of the 2024 evaluation.

### 31.2.5 Interactive Effects

Interactive effects occur when the implementation of energy efficiency measures has an impact on the energy consumption of other elements such as heating and cooling. For Residential Behaviour, interactive effects are already taken into account through the savings calculations since the billing analysis is conducted using whole house energy consumption data.

### 31.2.6 Effective Useful Life

For Residential Behaviour, energy savings are assessed annually through a billing analysis that serves to calculate the change in electricity consumption between the program evaluation year (post-program period) with the pre-program period. The pre-program period remains the same throughout the years. Therefore, the resulting savings correspond to both first-year savings and savings that persist over time. Therefore, an EUL of one year is used.

In the literature, behavioural programs typically use an EUL of one year across various jurisdictions, including Massachusetts, Illinois, Vermont, and New York, for the same reason.

### 31.2.7 Savings Deductions for Participation in Other Residential Programs

As mentioned in Subsection 29.1 above, a secondary aim of Residential Behaviour is to encourage customers to engage with other ENS programs tailored to their usage profiles. Therefore, treatment group customers are more encouraged to participate in other residential programs than control group customers. To avoid double counting Residential Behaviour savings already accounted for through other ENS programs, the Evaluator compared, for each wave, the treatment and control group levels of participation in EPI, GH, and HEA. Considering no information is collected on participants in Instant Savings, it was not possible to include that program component in the analysis.

If a statistically significant higher program participation level is observed in one of the treatment groups, savings deductions need to be calculated for that program. To calculate these deductions, the Evaluator estimates an average per household net annual savings value associated with each program with a higher participation level. The total savings deduction for each program consists of multiplying the difference in percentage of the participation level between the treatment and control groups by the average per household net annual savings value and the number of participants in the treatment group. If no statistically significant difference is found, no savings deduction is necessary.

As outlined in Table 85 below, there are statistically significant differences in participation levels between the treatment and control groups in Green Heat and EPI for high users as well as in Green Heat for medium users. Thus, savings deductions for participation in other residential programs needed to be made to those waves, the results of which are presented in Subsection 31.2.8 below. These results reveal that Residential Behaviour is successful at encouraging customers to participate in other residential programs offered by E1.

**Table 85: Other 2024 Program Participation Levels**

| Program                      | Treatment Participation Level | Control Participation Level | Difference (%) | Is the Difference Statistically Significant? |
|------------------------------|-------------------------------|-----------------------------|----------------|----------------------------------------------|
| <b>Wave 1 – High users</b>   |                               |                             |                |                                              |

### 31.2.8 Evaluated Net Savings

Net electrical energy savings are defined as the energy use reductions that are specifically attributable to Residential Behaviour. Program component net electrical energy savings were estimated using the following equation:

$$\text{Net Savings} = \text{Cumulative Savings} - \text{Savings Deductions for Participation in Other Programs}$$

The detailed results are listed in Table 86 below. The net electrical energy savings resulted in 2,961 tonnes of CO<sub>2</sub> eq in net annual GHG emission reductions. GHG emission reductions were calculated by applying the Nova Scotia-specific factor<sup>73</sup> for GHG emissions generated by electricity production to Residential Behaviour electrical energy savings.

**Table 86: Evaluated 2024 Residential Behaviour Net Electrical Energy Savings**

| Cohort                             | Wave 1       | Wave 2       | Wave 3       | Total        |
|------------------------------------|--------------|--------------|--------------|--------------|
| <b>Energy Savings</b>              |              |              |              |              |
| <b>Energy Savings (GWh)</b>        | <b>3.051</b> | <b>2.837</b> | <b>0.781</b> | <b>6.669</b> |
| Savings Deductions (GWh)           | 0.354        | 0.044        | 0.000        | 0.399        |
| <b>Net Energy Savings (GWh)</b>    | <b>2.696</b> | <b>2.793</b> | <b>0.781</b> | <b>6.270</b> |
| Effective Useful Life (years)      | 1            | 1            | 1            | 1            |
| <b>Net Lifetime Energy Savings</b> | <b>2.696</b> | <b>2.793</b> | <b>0.781</b> | <b>6.270</b> |

<sup>73</sup> At the time of writing, 2024 data were not yet available. The Nova Scotia-specific factor was obtained from Nova Scotia Power's 2023 total system emissions data (4,931,152 CO<sub>2</sub> eq tonnes) and total electricity generation (10,442 GWh) was drawn from the following two sources: Nova Scotia Power, Total System Emissions, <https://www.nspower.ca/clean-energy/air-emissions-reporting> (last accessed September 27, 2024) and Emera Inc., Emera Inc. 2023 Annual Report, p. 31, available at [https://s25.q4cdn.com/978989322/files/doc\\_financials/2023/ar/Emera\\_2023\\_AR\\_FINAL.pdf](https://s25.q4cdn.com/978989322/files/doc_financials/2023/ar/Emera_2023_AR_FINAL.pdf) (last accessed September 27, 2024).

As outlined in Figure 57 below, Residential Behaviour fell short of its target of 8.000 GWh in net electrical energy savings by 22%.

Figure 57: 2024 Residential Behaviour Targets and Evaluated Results

### 31.3 Realization Rate

No tracked savings were calculated for Residential Behaviour; therefore, there is no realization rate.

## 32 Residential Behaviour Key Findings and Recommendations

The main objectives of the 2024 Residential Behaviour evaluation were as follows:

- › Calculate net results, namely electrical first-year energy savings, as well as avoided GHG emissions

This section provides the Evaluator's key findings in relation to the above objectives. Pursuant to the 2024 evaluation, the Evaluator has no recommendations for Residential Behaviour.

### **2024 Residential Behaviour-Finding: Residential Behaviour fell short of its net electrical energy savings targets.**

Residential Behaviour achieved 6.270 GWh in net electrical energy savings in 2024, thus falling short of the planned net electrical energy savings of 8.000 GWh. This outcome is not surprising since the program component is still in its ramp-up phase after only eight months of operation. Savings are expected to gradually increase in the next months as participant engagement and adoption of new energy-saving actions increase. With achieved savings percentages ranging from 0.87% to 1.3% in the fall of 2024 depending on the wave, results are promising and indicate that the program component has potential for greater savings as it is scaled up.

### **2024 Residential Behaviour-Finding: The composition of the control and treatment groups remained similar between the initial selection (March 2024) and program component launch (May 2024).**

The Evaluator was responsible for selecting the treatment and control groups to ensure customers were randomly selected. An equivalency check was then performed as part of this evaluation to validate that the control and treatment groups remained similar at the time of program launch and confirm that no statistical differences that could negatively affect either group by introducing bias into savings calculations were revealed. Over the first year of evaluation, 13,439 accounts either became inactive or switched to solar. The attrition rate for high and medium users was 5.2% between May 2024 and December 2024 while it was 7.0% for low users. A large portion of the high attrition rates numbers is due to customers transitioning to solar.

### **2024 Residential Behaviour-Finding: Treatment group customers showed higher participation in other residential programs compared to the control group.**

Residential Behaviour successfully encouraged treatment participants to engage in other residential programs. Statistically significant differences in participation levels were observed among high users for Green Heat and EPI as well as among medium users for Green Heat. To avoid double-counting savings already attributed to other residential programs, savings deductions were applied to these cohorts.

## CONCLUSION

Table 87 presents the participation levels, net-to-gross ratios (NTGRs), evaluated gross and net savings at the generator, annual greenhouse gas (GHG) emission reductions, as well effective useful life (EUL) values for each program component and for Existing Residential as a whole.

**Table 87: Overall 2024 Existing Residential Participation and Evaluated Savings**

|                                | Participation Level |                    | Gross Savings |                  | NTGR   | Net Savings |                  |

| * The average NTGR values presented in this table correspond to the ratios of net savings to gross savings by program component and then for the entire program. |                     |                        |               |                  |        |             |                  |

Existing Residential was aimed at achieving 46.523 GWh in net electrical energy savings and 11.495 MW in net peak demand savings at the generator for 2024. The program was able to achieve planned energy and peak demand savings. AMH, EPI, Green Heat, MHEEP and Residential Behaviour fell below their energy targets, while ASFH and HEA exceeded theirs. AMH, EPI and Green Heat also fell below their peak demand targets, while ASFH, HEA and MHEEP exceeded theirs. AMH, ASFH, HEA and MHEEP participation levels reached their highest point in 2024, while Residential Behaviour was launched in 2024. HEA was the largest contributor to total program net energy (60%) and peak demand savings (61%).

## LIST OF APPENDICES

The following are presented in the Existing Residential Program – Appendices document.

### **Affordable Multifamily Housing**

Appendix I: AMH Tracking Sheet Audit

Appendix II: AMH Energy Auditor Interview Guide

Appendix III: AMH Participant Interview Guide

Appendix IV: AMH Dropped-out and Non-participant Interview Guide

Appendix V: AMH Protocol for Desk Reviews

Appendix VI: AMH 2024 Recommendations

## APPENDIX I

### AMH Tracking Sheet Audit

This appendix presents the main results of the tracking sheet audit performed by the Evaluator, which was aimed at:

- › Verifying that all data fields required for the evaluation were included and filled out in the tracking sheet submitted by EfficiencyOne (E1)
- › Ensuring that tracked results were accurate by:
  - › Verifying that parameters used to calculate program component results (gross and net electrical energy and peak demand savings at the generator) were consistent with previous evaluation results
  - › Validating that all calculation steps were performed consistently

Table 1 presents the corrected tracked savings resulting from tracking sheet audit conducted by the Evaluator.

**Table 1: 2024 AMH Corrected Tracked Savings**

| Program Component Results                        | Value Tracked by E1 |      | Corrected Tracked Value |      | Relative Difference |
|--------------------------------------------------|---------------------|------|-------------------------|------|---------------------|
|                                                  | Value               | Unit | Value                   | Unit | Value               |
| <b>AMH</b>                                       |                     |      |                         |      |                     |
| Gross Electrical Energy Savings at the Generator | 1.132               | GWh  | 1.158                   | GWh  | 2.30%               |
| Gross Peak Demand Savings at the Generator       | 0.580               | MW   | 0.580                   | MW   | -                   |
| Net Electrical Energy Savings at the Generator   | 1.132               | GWh  | 1.158                   | GWh  | 2.30%               |
| Net Peak Demand Savings at the Generator         | 0.580               | MW   | 0.580                   | MW   | -                   |

The difference between tracked and corrected electrical energy savings is due to an incorrect line loss factor used by E1 for residential participants.

## APPENDIX II

## Introduction

Please could I speak with <INSERT NAME>?

1. Yes **[CONTINUE]**
2. Not available **[ASK WHEN PERSON MIGHT BE AVAILABLE]**

Hello, my name is \_\_\_\_\_ and I'm calling from Narrative Research, a Halifax based market research company, on behalf of Efficiency Nova Scotia. We are performing an evaluation of Efficiency Nova Scotia's Affordable Multifamily Housing Program, which provides free energy audits and rebates on energy upgrades to those who qualify, and we are interested in your opinion as a program partner. The interview should take about 15 minutes. Is now a good time?

1. (Yes) **[CONTINUE]**
2. (No, later) **[RESCHEDULE]**
3. (No, refused) **[THANK AND TERMINATE]**

### A. Motivations for Participating

A1. From your experience, what are participants' main motivations for taking part in the Affordable Multifamily Housing program? **[MULTIPLE RESPONSES. RECORD FIRST MENTION SEPARATELY] [DO NOT READ]**

1. (The rebates offered / financial support)
2. (The energy efficiency measures included)
3. (To save money on energy bills)
4. (To have a more energy efficient building)
5. (To improve the comfort of their building)
6. (To improve tenant comfort)
7. (To be less wasteful)
8. (To help the environment / address environmental concerns)
9. (To reduce greenhouse gas emissions)
10. (To defer maintenance costs)
11. (To increase property value)
12. (Knowing someone else who had taken part in the program)
96. (Other, specify: \_\_\_\_\_)
98. **[EXCLUSIVE] Don't know [GO TO SECTION B]**
99. **[EXCLUSIVE] Refused [GO TO SECTION B]**

## B. Overall Strengths and Weaknesses

- B1. What are the main strengths of the Affordable Multifamily Program in your opinion? What else does the program do well? **[OPEN END]**.
- B2. And what are the main challenges of or barriers to the program? **[OPEN END]**

## C. Participants' Questions

- C1. What concerns about the program, if any, do participants typically have at the time of scheduling the energy audit with you? **[OPEN END]**
- C2. What concerns about the program, if any, do participants typically have during the energy audit? **[OPEN END]**
- C3. Which recommended technologies or upgrades generate the most questions from participants? **[DO NOT READ. MULTIPLE RESPONSES]**
1. (Building envelope upgrades (insulation))
  2. (Heat pumps)
  3. (Window and door replacements)
  4. (Hybrid heat pump water heaters)
  5. (Bathroom fans)
  6. (Hydronic heating system upgrades)
  7. (Common area lighting)
  96. (Other, specify: \_\_\_\_\_)
  97. (None)
  98. (Don't know)
  99. (Refusal)
- C4. **[DO NOT ASK IF CODES 97, 98, OR 99 AT C3]** What questions or concerns about these technologies or upgrades do participants have? **[OPEN END]**
- C5. What other questions do you typically get from participants during your initial visit for the energy audit? **[OPEN END]**

## D. Challenges/Barriers to Completion

- D1. In your experience, what reasons would lead someone who completed an energy audit of their building to choose not to go ahead with the recommended upgrades and discontinue their participation in the program? **[OPEN END]**
- D2. What (other) challenges do participants experience that may affect their decision to complete their participation in the program? **[OPEN END]**

- 
- D3. What have participants suggested would be useful to help them complete their projects? **[PROBE FOR: better communications, more check-ins, more explanations of the recommendations or upgrades, etc.] [OPEN END]**
- D4. What, if anything, could Efficiency Nova Scotia do to encourage participants to complete their involvement in the program? **[PROBE FOR: marketing, program design changes, etc.] [OPEN END]**

## **E. Satisfaction**

- E1. On a scale of 0 to 10, where 0 is “Not at all satisfied” and 10 is “Completely satisfied,” how satisfied are you with each of the following ten aspects of the Affordable Multifamily Housing program? **[DO NOT RANDOMIZE] [RECORD NUMBER. DO NOT ACCEPT A RANGE] [ASK E2 AND E3 AFTER EACH ITEM <8 AT E1]**
- a. The information about the participant and the project that Efficiency Nova Scotia provides you at the start of a new project
  - b. The initial energy audit scheduling process with the participant
  - c. The initial audit reporting template
  - d. The simulator software you use to complete the audit and establish energy savings
  - e. The timeframe you have to submit your energy audit report, photos, and analysis to Efficiency Nova Scotia (10 days)
  - f. The information Efficiency Nova Scotia sends you about the actual upgrades so you can update the energy model
  - g. The final energy audit scheduling process with the participant
  - h. The final audit reporting template
  - i. The selection of upgrades available in the program
  - j. The communications you have with Efficiency Nova Scotia
  - k. The overall reporting to Efficiency Nova Scotia
- [0-10 SCALE WITH END POINT LABELS– RECORD NUMBER]**
- 97.** Not applicable
  - 98.** Don’t Know/Don’t recall
  - 99.** Refused
- E2. **[ASK FOR EACH ITEM <8 AT E1]** Why aren’t you more satisfied? **[OPEN END]**
- E3. **[ASK FOR EACH ITEM <8 AT E1]** How could this be improved? **[OPEN END]**
- E4. Are there any other issues or challenges you experienced with the Affordable Multifamily Housing program that we haven’t mentioned? **[OPEN END]**

## **F. Recommendations for Program Improvements**

- F1. What information, tools, support, or training would make your role in the Affordable Multifamily Housing program easier? **[OPEN END]**
- F2. Do you have any ideas how to better communicate or market the program to attract more participants? **[OPEN END]**
- F3. Apart from those you have already mentioned, do you have any other recommendations for improving the Affordable Multifamily Housing program? Anything else? **[OPEN END]**
- F4. Do you have any final comments you'd like to add about the program? **[OPEN END]**

**END:** Those are all the questions I have for you. I thank you very much for your time and cooperation. Have a nice day!

## APPENDIX III

## Introduction

Please could I speak with <INSERT NAME>?

1. Yes **[CONTINUE]**
2. No **[SAY “PERHAPS YOU CAN HELP ME ANYWAY.” CONTINUE]**

Hello, my name is \_\_\_\_\_ and I’m calling from Narrative Research, a Halifax based market research company on behalf of Efficiency Nova Scotia. We are performing an evaluation of Efficiency Nova Scotia’s energy efficiency services. Our records indicate that you recently participated in the Affordable Multifamily Housing Program for the building at <FACILITY STREET ADDRESS> in <FACILITY TOWN>. Is that correct?

**[IF NEEDED:** The program offers up to 80% in rebates on energy efficient upgrades to qualifying multi-unit residential rental properties and qualifying non-profit support services. Upgrades may include improvements to space and water heating, window and door replacements, insulation, and more]

1. Yes **(CONTINUE)**
2. Someone else might know **(ASK TO SPEAK TO THEM)**
3. No **(THANK AND TERMINATE)**

We would appreciate your help in answering questions about the program. The information you provide will help Efficiency Nova Scotia improve the program. Today’s call should take about 25-30 minutes. Is this a good time for you?

1. (Yes) **[CONTINUE]**
2. (No, later) **[RESCHEDULE]**
3. (No, refused) **[THANK AND TERMINATE]**

## A. Verification

A1. Our records indicate that you received a rebate from Efficiency Nova Scotia for installing <MEASURE TYPE> upgrades. Is this correct?

1. Yes **[CONTINUE]**
2. No **[PROBE:** Are you sure? According to our records, you would have received a rebate from Efficiency Nova Scotia for <MEASURE TYPE>. **[IF YES CONTINUE. IF PERSIST AS NO, THANK, TERMINATE, RECORD AND KEEP DATA]**
99. Don’t know/Refused **[PROBE:** “Is there someone else available who would know about having participated in the Affordable Multifamily Housing program?”] **[IF YES, ASK TO SPEAK TO THE APPROPRIATE PERSON AND RESTART AT INTRODUCTION. IF PERSISTS AS NO, THANK, TERMINATE, RECORD AND KEEP DATA.]**

- 
- A2. What type of building is the building at <FACILITY STREET ADDRESS> in <FACILITY TOWN>?
1. A multi-unit residential building or co-operative with 1 to 3 units
  2. A multi-unit residential building or co-operative with 4 or more units
  3. A non-bed facility
  4. A shelter
  5. A rooming house
  96. Other (specify: \_\_\_\_\_)
  99. (Refused)

[RECORD <PATH> FROM DATABASE AND CHECK QUOTAS]

## **B. Awareness and Motivations for Participating**

- B1. How did you first become aware of the Affordable Multifamily Housing program? **[DO NOT READ. SINGLE RESPONSE]**
1. (Efficiency Nova Scotia Energy Solutions Advisor)
  2. (Contractors)
  3. (Social housing associations)
  4. (Landlord association)
  5. (Trade publication)
  6. (Trade shows / conferences)
  7. (Efficiency Nova Scotia electricity bill)
  8. (Online search (e.g. Google, Yahoo))
  9. (Social media (e.g. Facebook, Twitter, YouTube))
  10. (Efficiency Nova Scotia website)
  11. (Government of Nova Scotia)
  96. (Other (specify) \_\_\_\_\_)
  98. **[EXCLUSIVE]** (Don't know)
  99. **[EXCLUSIVE]** (Refused)

B2. What was the SINGLE most important reason you were interested in participating in the Affordable Multifamily Housing program? **[SINGLE RESPONSE. RECORD VERBATIM] [DO NOT READ]**

1. (Wanted the heat pump)
2. (The rebates offered / financial support)
3. (The energy efficiency measures included)
4. (To save money on energy bills)
5. (To have a more energy efficient building)
6. (To improve the comfort of my building)
7. (To improve tenant comfort)
8. (To be less wasteful)
9. (To help the environment / address environmental concerns)
10. (To reduce greenhouse gas emissions)
11. (To defer maintenance costs)
12. (To increase property value)
13. (I knew someone else who had taken part in the program)
14. (The E1 representative was convincing)
98. **[EXCLUSIVE]** Don't know **[GO TO B4]**
99. **[EXCLUSIVE]** Refused **[GO TO B4]**

B3. Were there any other reasons? **[DO NOT READ. ACCEPT MULTIPLE RESPONSES. RECORD VERBATIM. USE CODES FROM A1]**

97. **[EXCLUSIVE]** None/no other reasons
98. **[EXCLUSIVE]** Don't know
99. **[EXCLUSIVE]** Refused

B4. As you may know, there are two possible pathways through the Affordable Multifamily Housing program: the **Prescriptive** path and the **Comprehensive** path. Did you know that there were two paths through the program?

1. Yes
2. No
99. Refused

- 
- B5. **[ASK IF CODES 2-5 OR 96 AT A2 AND CODE 1 AT A1]** Do you recall which path you followed through the program? **[SINGLE RESPONSE]**
1. Yes, the prescriptive path **[CHECK TO SEE IF MATCHES WITH <PATH>]**
  2. Yes, the comprehensive path **[CHECK TO SEE IF MATCHES WITH <PATH>]**
  3. No, I didn't know there were two paths
  4. No, I don't recall / I'm unsure
98. **[EXCLUSIVE]** Don't know
99. **[EXCLUSIVE]** Refused
- B6. **[ASK IF CODES 1 OR 2 AT B5 AND MATCH WITH <PATH> IS CORRECT]** Could you briefly describe the main differences between the Prescriptive and the Comprehensive paths? **[OPEN END]**
- B7. **[ASK IF CODES 1 OR 2 AT B5 AND MATCH WITH <PATH> IS INCORRECT OR IF CODES 3, 4, 98 OR 99 AT B5]** The Prescriptive path is for affordable rental buildings of one-to-three units and incorporates a selection of lighting, heating and water heating upgrades. The Comprehensive path is for affordable rental buildings of four or more units. An energy audit of the building is conducted, the possible energy efficiency upgrades listed, and the participant selects the upgrades to be installed. Our records show that you took the **<PATH>** path. Do you recall now?
1. Yes
  2. No
99. **[EXCLUSIVE]** (Refusal)
- B8. **[ASK IF CODES 2-5 OR 96 AT A2]** Why did you choose to take the **<PATH>** path of the program? **[OPEN END]**

## **C. Satisfaction**

- C1. **[NET PROMOTER SCORE]** Using a 0 to 10 scale, where 0 means "Definitely would not" and 10 means "Definitely would", what is the likelihood that you recommend the Affordable Multifamily Housing program to other housing providers or affordable multifamily residential building owners? **[RECORD NUMBER. DO NOT ACCEPT A RANGE]**
- [0-10 SCALE WITH END POINT LABELS– RECORD NUMBER]**
98. Don't Know/Don't recall
99. Refused

- C2. Using a scale from 0 to 10 where 0 is “Not at all satisfied” and 10 is “Completely satisfied”, how would you rate your satisfaction with the Affordable Multifamily Housing program overall? **[RECORD NUMBER. DO NOT ACCEPT A RANGE] [ASK E2 AFTER EACH ITEM <8 AT C2].**

**[0-10 SCALE WITH END POINT LABELS– RECORD NUMBER]**

98. Don't Know

99. Refused

- C3. **[IF D<8]** What is the main reason you are not more satisfied with the program overall? Are there other reasons? **[PROBE FOR SPECIFIC REASON. RECORD FIRST MENTION AND THEN ACCEPT MULTIPLE RESPONSES KEEPING CODE 98 EXCLUSIVE]**

96. **RECORD VERBATIM – FIRST RESPONSE:** \_\_\_\_\_

96. **RECORD VERBATIM – SUBSEQUENT RESPONSES:** \_\_\_\_\_

98. Don't know

99. Refused

- C4. Using a scale of 0 to 10, where 0 is “Not at all satisfied” and 10 is “Completely satisfied,” how satisfied were you with each of the following aspects of the Affordable Multifamily Housing program? Please indicate if any do not apply to you. **[DO NOT RANDOMIZE] [ASK E2 AFTER EACH ITEM <8 AT E1]**

a. The program application process

b. The selection of upgrades available in the program

c. The upgrades installed in your building

d. The quality of the work completed

e. The time it took to complete the program

f. The amount of the overall rebate

g. **[ASK COMPREHENSIVE PATH ONLY]** The ability to receive 50% of the rebate before the end of the project

h. The time required to receive the rebate

i. The communications you had with Efficiency Nova Scotia

**[0-10 SCALE WITH END POINT LABELS– RECORD NUMBER]**

97. (Not applicable)

98. (Don't Know/Don't recall)

99. (Refused)

- C5. **[ASK FOR EACH ITEM <8 AT E1]** Why aren't you more satisfied? **[OPEN END]**

C6. Using the same scale of 0 to 10, where 0 is “Not at all satisfied” and 10 is “Completely satisfied,” how satisfied are you with the following forms and reports included in the Affordable Multifamily Housing program? Please indicate if any do not apply to you. **[DO NOT RANDOMIZE] [RECORD NUMBER. DO NOT ACCEPT A RANGE] [ASK C7 AFTER EACH ITEM <8 AT C6]**

- a. **[ASK IF COMPREHENSIVE PATH ONLY]** The energy efficiency Upgrade Recommendation report you received from E1
- b. The Rebate Request form you submit to E1 to request a rebate payment (including all contractor invoices, list of rental rates (for buildings that charge rent), a void cheque and payment information)
- c. The Preapproval Documentation that E1 sends you informing you that you can move forward with the upgrades

**[0-10 SCALE WITH END POINT LABELS– RECORD NUMBER]**

- 97. (Not applicable)
- 98. (Don't Know/Don't recall)
- 99. (Refused)

C7. **[ASK FOR EACH ITEM <8 AT C6]** Why aren't you more satisfied? **[OPEN END]**

C8. Using a scale of 0 to 10, where 0 is “Completely disagree” and 10 is “Completely agree”, how strongly do you agree or disagree with the following statements about the Affordable Multifamily Housing program forms and reports? **[RECORD NUMBER. DO NOT ACCEPT A RANGE]**

- a. The Affordable Multifamily Housing program application form was easy to complete
- b. The instructions on how to fill out the Affordable Multifamily Housing program application form were simple to understand
- c. **[ASK COMPREHENSIVE PATH ONLY]** The energy efficiency Upgrade Recommendation report provided by Efficiency Nova Scotia was simple to understand
- d. The Rebate Request form was easy to complete
- e. The instructions on how to fill out the Rebate Request form were simple to understand
- f. The Preapproval Documentation form provided by Efficiency Nova Scotia was simple to understand

**[0-10 SCALE WITH END POINT LABELS– RECORD NUMBER]**

- 97. (Not applicable)
- 98. (Don't Know/Don't recall)
- 99. (Refused)

C9. **[ASK COMPREHENSIVE PATH ONLY]** We'd like to understand your experience regarding the energy audit process. On a scale of 0 to 10, where 0 is "Not at all satisfied" and 10 is "Completely satisfied," how satisfied are you with each of the following aspects related to the free energy audit you received? **[DO NOT RANDOMIZE] [ASK C10 AFTER EACH ITEM <8 AT C9]**

- a. The overall service provided by the energy auditor
- b. The energy audit appointment scheduling process
- c. The ability of the energy auditor to answer questions
- d. The information provided by the energy auditor

**[0-10 SCALE WITH END POINT LABELS– RECORD NUMBER]**

- 97. (Not applicable)
- 98. (Don't Know/Don't recall)
- 99. (Refused)

C10. **[ASK FOR EACH ITEM <8 AT C9]** Why aren't you more satisfied? **[OPEN END]**

C11. Are there any other issues or challenges you experienced with the Affordable Multifamily Housing program that we haven't mentioned? **[OPEN END]**

C12. What, if any, unanswered questions do you have about the different technologies installed in your building through the program?

Specify \_\_\_\_\_

- 97. None
- 98. (Don't know)
- 99. (Refusal)

## **D. Operating Agreement (Affordability Covenant)**

D1. **[ASK IF A2 ≠ 3 (Non-bed). IF A2 = 3, CODE D1 AS NO]** Do you charge rent to tenants in your building/at your facility?

- 3. Yes
- 4. No
- 99. (Refused)

D2. **[ASK IF D1=1]** You may recall that as part of the conditions of the program, property owners of facilities where rent is charged must agree to the terms of a multi-year transferrable Affordable Multifamily Housing Operating Agreement (or affordability covenant) that ensures affordability for renters. What are your thoughts on the operating agreement/affordability covenant in facilities where rent is charged? **[PROBE FOR PERCEPTIONS ABOUT TERM LENGTH, RENTAL RATES. PROBE TO UNDERSTAND WHETHER IT IS PERCEIVED POSITIVELY OR NEGATIVELY AND WHAT IS POSITIVE/NEGATIVE. NARRATIVE TO PREPARE A "POSITIVE" NET AND A "NEGATIVE" NET.]**

- 
- D3. **[ASK IF PERCEIVED “NEGATIVELY” AT D1]** What specifically about the operating agreement/affordability covenant do you dislike? **[OPEN END]**
- D4. **[ASK IF D1=1]** In your opinion, what, if any, modifications could be made to the operating agreement/affordability covenant to make it more appealing to other owners of affordable multifamily housing? **[OPEN END]**

## **E. Recommendations for Program Improvements**

- E1. Do you have any (other) recommendations for improving the Affordable Multifamily Housing program? **[PROBE]** Anything else? **[DO NOT READ. ACCEPT MULTIPLE KEEPING CODE 97, 98 AND 99 EXCLUSIVE]**
1. (Increase the rebate)
  2. (Offer additional equipment eligible for rebates. Specify \_\_\_\_\_))
  3. (Offer more information on the equipment recommended)
  4. (Simplify program application, forms, and associated paperwork)
  5. (Speed up the process)
  6. (Reduce the term of the Operations Agreement. Specify \_\_\_\_\_)
  7. (“Other” Operations Agreement. Specify \_\_\_\_\_)
  8. (Advertise the program more or in a better way. Specify \_\_\_\_\_)
  9. (Improve the online portal. Specify \_\_\_\_\_)
  96. (Other [SPECIFY \_\_\_\_\_])
  - 97.** (No recommendation)
  - 98.** (Don’t know)
  - 99.** (Refused)

E2. Which of the following seven tools or support would be the most helpful for participants in the Affordable Multifamily Housing program? Please choose your top three. **[READ AND RANDOMIZE. SELECT UP TO THREE. NOTE IN ORDER]**

- a. Case studies
- b. Help selecting equipment
- c. Help finding contractors
- d. Information on the upgrades installed
- e. Technical/maintenance support
- f. Low-interest financing
- g. Co-funding

- 1. Most helpful
- 2. Second most helpful
- 3. Third most helpful

**98.** **[EXCLUSIVE]** (Do not know)

**99.** **[EXCLUSIVE]** (Refusal)

E3. How do you most prefer to receive information about rebate programs and energy retrofits? Please provide your top two most preferred. **[READ. SELECT MAXIMUM OF TWO ANSWERS]**

- 1. Email
- 2. Postal mail
- 3. Website
- 4. Social media
- 5. In-person seminars
- 6. Webinars

**98.** (Do not know)

**99.** (Refusal)

## **F. Annual Energy Efficiency and Budget**

F1. Moving on to a different topic, what is your annual budget for building maintenance and efficiency upgrades?

- 1. Specify \$\_\_\_\_\_

**98.** (Don't know)

**99.** (Refusal)

F2. Did you consider a payback period when deciding whether to go ahead with the Affordable Multifamily Housing program?

1. Yes

2. No

**98.** (Don't Know/Don't recall)

**99.** (Refusal)

F3. **[ASK IF CODE 1 AT F2]** What payback period did you use to decide whether to go ahead with the program? **[READ. SELECT ONE]**

1. Less than 5 years

2. 5 to 10 years

3. 11 to 15 years

4. 16 to 20 years

5. More than 20 years

**98.** (Do not know)

**99.** (Refusal)

F4. Do your tenants pay utility costs?

1. Yes

2. No

**98.** (Don't know)

**99.** (Refusal)

**END:** Those are all the questions I have for you. I thank you very much for your time and cooperation.  
Have a nice day!

## Introduction

Could I speak with <INSERT NAME>?

1. Yes [CONTINUE]
2. No [SAY “PERHAPS YOU CAN HELP ME ANYWAY.” CONTINUE]

Hello, my name is \_\_\_\_\_ and I’m calling from Narrative Research, a Halifax based market research company, on behalf of Efficiency Nova Scotia. We are performing an evaluation of Efficiency Nova Scotia’s energy efficiency services. We are doing follow-up research with people who [DROPPED OUT PARTICIPANTS INSERT: started but did not complete; NON-PARTICIPANTS INSERT: decided not to participate in], the Affordable Multifamily Housing Program, an energy savings program.

[IF NEEDED: The program offers UP TO 80% in rebates on energy efficient upgrades to qualifying multi-unit residential rental properties and non-profit buildings. Upgrades may include improvements to space and water heating, window and door replacements, insulation, and more. Does that sound familiar?]

1. Yes, that sounds familiar (CONTINUE)
2. Yes, someone else might know (ASK TO SPEAK TO THEM)
3. No (THANK AND TERMINATE)

**S1.** Our records show that you [DROPPED OUT PARTICIPANTS INSERT: decided not to complete your participation in the program for the building at < INSERT FACILITY STREET ADDRESS >; NON-PARTICIPANTS INSERT: talked to an Efficiency Nova Scotia representative but decided not to participate in the Affordable Multifamily Housing program]. We’d like to ask you a few questions to understand the reasons for this. I can assure you that we are not trying to sell you anything. Efficiency Nova Scotia would like this information to assist in their efforts to improve the service they provide for their customers. Today’s call should take about [DROPPED OUT PARTICIPANTS INSERT: 15 to 20 minutes; NON-PARTICIPANTS INSERT: 10 to 15 minutes]. Is this a convenient time to talk? IF NECESSARY: I can assure you that I will not try to sell you anything. Please be advised that this call may be recorded for quality assurance.

1. (Yes) [CONTINUE]
2. (No, later) [RESCHEDULE]
3. (No, refused) [THANK AND TERMINATE]
4. (I am in the process of completing the program) [THANK AND TERMINATE AND RECORD INCIDENCE]
5. I have now completed the program [THANK AND TERMINATE AND RECORD INCIDENCE]

[NOTE FOLLOWING VARIABLES FROM DATABASES:

- PATH (PRESCRIPTIVE OR COMPREHENSIVE)

- HOUSING TYPE (MURB, ROOMING HOUSE, RENTAL/CO-OPERATIVE (1-3 UNITS), RENTAL/CO-OPERATIVE (4+ UNITS), NON-BED, SHELTER]

**S2. [ASK DROPPED OUT PARTICIPANTS AND HOUSING TYPE=MURB ONLY]** The information we have shows that the building at < **INSERT FACILITY STREET ADDRESS** > is a multi-unit residential building. How many units are there in this building?

1. 1 to 3 units
2. 4 or more units

**99. [EXCLUSIVE]** (Refused)

## **A. Program Awareness and Initial Motivations to Participate**

A1. To start, how did you first learn about Efficiency Nova Scotia's Affordable Multifamily Housing program? **[DO NOT READ LIST. ACCEPT MULTIPLE RESPONSES]**

1. (Efficiency Nova Scotia Energy Solutions Advisor)
2. (Contractors)
3. (Social housing associations)
4. (Landlord association)
5. (Trade publication)
6. (Trade shows / conferences)
7. (Efficiency Nova Scotia electricity bill)
8. (Online search (e.g. Google, Yahoo))
9. (Social media (e.g. Facebook, Twitter, YouTube))
10. (Efficiency Nova Scotia website)
11. (Government of Nova Scotia)
96. (Other (specify) \_\_\_\_\_)

**98. [EXCLUSIVE]** (Don't know)

**99. [EXCLUSIVE]** (Refused)

A2. What was it about the program that interested you at first? Anything else? **(DO NOT READ LIST. ACCEPT MULTIPLE RESPONSES)**

1. (The rebates offered / financial support)
2. (The energy efficiency measures included)
3. (To save money on energy bills)
4. (To have a more energy efficient building)
5. (To improve the comfort of my building)
6. (To improve tenant comfort)
7. (To be less wasteful)
8. (To help the environment / address environmental concerns)
9. (Reduce greenhouse gas emissions)
10. (To defer maintenance costs)
11. (To increase property value)
12. (I knew someone else who had taken part in the program)
13. (The E1 representative was convincing)
96. (Other (specify) \_\_\_\_\_)
98. **[EXCLUSIVE]** (Don't Know)
99. **[EXCLUSIVE]** (Refusal)

A3. What were your expectations regarding the benefits you would receive from participating in the Affordable Multifamily Housing program? **[OPEN END]**

A4. Did you know that there are two pathways through the Affordable Multifamily Housing program? The **Prescriptive** path is for affordable rental buildings of one-to-three units and incorporates a selection of lighting, heating and water heating upgrades. The **Comprehensive** path is for affordable rental buildings of four or more units. An energy audit of the building is conducted, the possible energy efficiency upgrades listed, and the participant selects the upgrades to be installed.

1. Yes, I know the two pathways
2. No, I didn't know there were two pathways
99. **[EXCLUSIVE]** (Refusal)

## B. Reasons for Ending / Barriers to Participation

- B1. **[ASK DROPPED OUT PARTICIPANTS ONLY]** The information I have shows that you have not continued your participation in the Affordable Multifamily Housing program for the building at < **INSERT FACILITY STREET ADDRESS** >. Is this correct? **[DO NOT READ]**
1. Yes, correct
  2. No, incorrect
- B2. **[ASK IF NO (CODE 2 AT B1)]** Please could you give me more details about the situation? **[OPEN END]**
- [THANK AND TERMINATE AFTER B2 IF CODE 2 AT B1]**
- B3. **[ASK DROPPED OUT PARTICIPANTS ONLY]** At what stage did you end your participation in the Affordable Multifamily Housing program? Was it... **[READ. ONE ANSWER ONLY]**
1. After the initial contact with the program representative once they'd sent you the application form and operating agreement/affordability covenant documents
  2. After completing the application but before signing the operating agreement/affordability covenant
  3. **[COMPREHENSIVE PATH ONLY]** After you had completed your application and signed the operating agreement/affordability covenant, but before or during the auditor's visit for the initial pre-renovation energy assessment. (IF NEEDED: The energy assessment includes a visit by the auditor to determine the work that can be done.)
  4. **[COMPREHENSIVE PATH ONLY]** After the pre-renovation energy assessment, but before you selected any energy upgrades.
  5. After you had selected the energy upgrades, but before any renovation work was completed.
  96. At another point (specify) \_\_\_\_\_
  98. **[DO NOT READ]** Do not recall

- B4. Why did you [DROPPED OUT PARTICIPANTS INSERT: not continue with; NON-PARTICIPANTS INSERT: decide not to participate in] the Affordable Multifamily Housing program? Any other reasons? [DO NOT READ LIST. ACCEPT MULTIPLE RESPONSES. PROBE IN DEPTH]

**RECORD VERBATIM RESPONSE AND THEN CODE:** \_\_\_\_\_

**[Communication problems]**

1. I lost interest as it took too long for E1/representative to contact/get back to me
2. Other communication problems (**PLEASE SPECIFY** \_\_\_\_\_)

**[Ineligibility]**

3. I was not eligible for the program because I don't have enough low-income tenants
4. My building was not eligible for the program (**PLEASE SPECIFY** \_\_\_\_\_)
5. Other eligibility issues (**PLEASE SPECIFY** \_\_\_\_\_)

**[Application difficulties]**

6. I couldn't provide all the documents required for the application process
7. The requirements for documentation were unclear
8. Other application difficulties (**PLEASE SPECIFY** \_\_\_\_\_)

**[Operating Agreement / Affordability Covenant]**

9. I didn't want to sign the operating agreement/affordability covenant
10. The term of the operating agreement was too long
11. I didn't like the rent rates (too low)
12. I want to be able to manage my rent levels myself (without an affordability covenant)
13. Other operating agreement difficulties (**PLEASE SPECIFY** \_\_\_\_\_)

**[Problems with representative during application process]**

14. The representative I dealt with during the application process was not knowledgeable
15. The representative I dealt with during the application process did not explain the process well
16. The representative I dealt with during the application process was not courteous nor polite

**[Upgrades]**

17. The upgrades I wanted were not offered by the program [**ASK WHICH ONES** \_\_\_\_\_]
18. The work I had wanted completed would not have been included in the renovation [**ASK WHICH WORK** \_\_\_\_\_]

### **[Problems pre-renovation assessment]**

- 19. It took too long to schedule the initial pre-renovation assessment
- 20. The advisor I dealt with during the pre-renovation assessment process was **not knowledgeable**
- 21. The advisor I dealt with during the pre-renovation process **did not explain the process well**
- 22. The advisor I dealt with during the pre-renovation process was **not courteous nor polite**
- 23. The advisor I dealt with during the pre-renovation process **did not arrive on time** for the scheduled appointment
- 24. The advisor I dealt with during the pre-renovation process **did not complete** the assessment **in a timely manner**
- 25. The advisor I dealt with during the pre-renovation process **did not respect my building**

### **[Financial Reasons]**

- 26. I hadn't realised how much the upgrades would cost
- 27. The available budget didn't stretch far enough
- 28. The payback period was too long
- 29. The incentives were too low
- 30. Split incentives (tenants pay their own energy bills, so I don't benefit from the whole incentive)
- 31. Other financial reasons **[PLEASE SPECIFY \_\_\_\_\_]**

### **[Problems renovation work]**

- 32. I hadn't realised how long the renovation work would take / the extent of the renovation work
- 33. I didn't want the mess of the renovation work
- 34. It was taking too long to schedule the renovation work/ difficult to organise
- 35. I was unable to prepare my building for renovation
- 36. It was difficult to find contractors
- 37. Other renovation reasons (**PLEASE SPECIFY \_\_\_\_\_**)

### **[Other]**

- 38. I took part in another program **[ASK WHICH ONE \_\_\_\_\_]**
- 39. Property has been sold
- 40. Personal situation/illness
- 41. External events
- 96. Other (specify \_\_\_\_\_)
- 98. Don't know
- 99. Do not recall

## C. Affordability Covenant

- C1. **[ASK IF HOUSING TYPE ≠ NON-BED. IF HOUSING TYPE = NON-BED, CODE AS NO]** Do you charge rent to tenants in your building/at your facility?
1. Yes
  2. No
- 99.** (Refused)
- C2. **[ASK IF C1=YES]** You may recall that as part of the conditions of the program, property owners of facilities where rent is charged must agree to the terms of a multi-year transferrable Affordable Multifamily Housing Operating Agreement (or affordability covenant) that ensures affordability for renters.] What are your thoughts on the operating agreement/affordability covenant for facilities where rent is charged? **[PROBE FOR PERCEPTIONS ABOUT TERM LENGTH, RENTAL RATES. PROBE TO UNDERSTAND WHETHER IT IS PERCEIVED POSITIVELY OR NEGATIVELY AND WHAT IS POSITIVE/NEGATIVE. OPEN END PREPARE A “POSITIVE” NET AND A “NEGATIVE” NET.]**
- C3. **[ASK IF C1=YES AND CODES 9 OR 13 AT B4]** What specifically about the operating agreement/affordability covenant made you decide not to pursue the program? **[OPEN END]**
- C4. **[ASK IF C1=YES AND CODES 9 OR 13 AT B4 OR IF PERCEIVED “NEGATIVELY” AT D]** In your opinion, what modifications could be made to the operating agreement/affordability covenant that would help you see it in a more positive light? **[OPEN END]**
- C5. **[ASK IF C1=YES AND COMPREHENSIVE PATH]** If the agreement were reduced from 12 years to 10 years, would your opinion of it change?
1. Yes. **[ASK How? \_\_\_\_\_]**
  2. No
- 98.** (Don't know)
- 99.** (Refusal)
- C6. **[ASK IF C1=YES AND PRESCRIPTIVE PATH]** If the agreement were reduced from 6 years to 5 years, would your opinion of it change?
1. Yes. **[ASK How? \_\_\_\_\_]**
  2. No
- 98.** (Don't know)
- 99.** (Refusal)

- C7. **[ASK IF CODE 2 AT C5 OR C6]** What would be an acceptable term length in your opinion? **[SINGLE RESPONSE.]**

PRESCRIPTIVE PATH ACCEPTABLE TERM: \_\_\_\_\_ years

COMPREHENSIVE PATH ACCEPTABLE TERM: \_\_\_\_\_ years

98. (Don't know)

99. (Refusal)

## **D. Alternatives for Implementing Other Energy Efficiency Measures**

- D1. **[ASK IF NOT CODE 38 AT B4]** Have you taken part or considered taking part in another energy efficiency program(s)? **[SINGLE RESPONSE]**

1. Yes, taken part **[ASK WHICH ONE(S) \_\_\_\_\_]**

2. Yes, considered **[ASK WHICH ONE(S) \_\_\_\_\_]**

3. No

99. (Refusal / Prefer not to answer)

- D2. **[IF CODE 1 OR 2 AT D1 OR CODE 38 AT B4]** What made you **[INSERT IF CODE 1 AT D1 OR CODE 38 AT B4: choose; INSERT IF CODE 2 AT D1: consider taking part in]** this program rather than the Affordable Multifamily Housing Program? **[OPEN END]**

- D3. Have you sought additional funding, other than an energy efficiency program, to help implement energy efficiency measures in your building? Please describe. **[PROBE FROM WHAT AND FROM WHERE? OPEN END]**

- D4. What, if any, energy efficiency upgrades have you made to your building in the past year? **(READ. MULTIPLE RESPONSES.)**

1. Building envelope upgrades (insulation)

2. Heat pumps

3. Window and door replacements

4. Hybrid heat pump water heaters

5. Bathroom fans

6. Hydronic heating system upgrades

7. Common area lighting

96. Other custom upgrades (specify: \_\_\_\_\_)

97. None

98. (Don't know)

99. (Refusal)

- D5. What is your annual budget for building maintenance and efficiency upgrades? **[READ. SELECT ONE]**
1. Specify \$\_\_\_\_\_
  - 98.** (Do not know)
  - 99.** (Refusal)
- D6. What payback period do you consider reasonable when implementing energy efficiency upgrades in your building? **[READ. SELECT ONE]**
1. Less than 5 years
  2. 5 to 10 years
  3. 11 to 15 years
  4. 16 to 20 years
  5. More than 20 years
  6. (Depends)
  - 98.** (Do not know)
  - 99.** (Refusal)
- D7. **[ASK IF D6=6]** How does your expectation of the payback period vary based on the types of upgrades? **[OPEN END]**
- D8. Do your tenants pay utility costs?
1. Yes
  2. No
  - 98.** (Don't know)
  - 99.** (Refusal)

## E. Suggested Improvements

- E1. What could Efficiency Nova Scotia do to improve the Affordable Multifamily Housing Program? **[OPEN END]**
- E2. How helpful would the following tools or support be to the program? **[READ AND RANDOMIZE. ASK FOR EACH]**
- a. Case studies
  - b. Help selecting equipment
  - c. Help finding contractors
  - d. Information on the upgrades installed
  - e. Technical/maintenance support
  - f. Low-interest financing
  - g. Co-funding
- 1. Extremely helpful
  - 2. Helpful
  - 3. Not very helpful
  - 4. Not at all helpful
  - 98.** (Do not know)
  - 99.** (Refusal)
- E3. How do you prefer to receive information about rebate programs and energy retrofits? **[READ. SELECT ALL THAT APPLY]**
- 1. Email
  - 2. Postal mail
  - 3. Website
  - 4. Social media
  - 5. In-person seminars
  - 6. Webinars
  - 98.** (Do not know)
  - 99.** (Refusal)

## F. Interest in the AMH Program

- F1. **[DO NOT ASK IF INELIGIBLE AT ANY PART OF B4 (CODE 3, 4, 5)]** Would you be extremely interested, interested, not very interested or not at all interested in **[INSERT IF DROPPED-OUT PARTICIPANTS: completing; IF NON-PARTICIPANTS: reapplying to]** the Affordable Multifamily Housing Program you started?
1. Extremely interested
  2. Interested
  3. Not very interested
  4. Not at all interested
- 98.** (Do not know)
- 99.** (Refusal)
- F2. **[ASK IF CODES 3, 4, 98 OR 99 AT F1]** Why aren't you more interested in **[INSERT IF DROPPED-OUT PARTICIPANTS: completing; IF NON-PARTICIPANTS: reapplying to]** the program? **[OPEN END]**
- F3. **[ASK IF CODES 3, 4, 98 OR 99 AT F1]** What could Efficiency Nova Scotia do to motivate you to **[DROPPED-OUT INSERT: complete; NON-PARTICIPANT INSERT: participate in]** the Affordable Multifamily Housing program? **[OPEN END]**
- F4. **[ASK IF CODES 1 OR 2 AT F1]** Would you be willing to be contacted by Efficiency Nova Scotia about completing the program?
1. Yes
  2. No
- 99.** (Refusal)
- F5. Do you have any other comments about the program before we finish? **[OPEN END]**

**END:** That is all the questions I have. Thank you for your time.

## APPENDIX V

### AMH Protocol for Desk Reviews

Desk reviews were conducted to measure information and validate if this information was correctly modelled or used in savings calculations. Table 1 presents the protocol used for project reviews.

**Table 1: Protocol Used for Project Reviews**

|                                                                                           |   |   |       |
|-------------------------------------------------------------------------------------------|---|---|-------|
| Project ID                                                                                |   |   |       |
| Facility Address                                                                          |   |   |       |
| Project Contact Name                                                                      |   |   |       |

| Notes on savings change:<br>- What was incorrect?<br>- What change was made?<br>- Were the new values come from? |  |  |  |

## APPENDIX VI

### AMH 2024 Recommendations

---

This appendix summarizes all the recommendations made by the Evaluator as part of the 2024 AMH evaluation.

| Section           | Recommendations                                                                                                                                                                                                                                                                         |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Executive Summary | Recommendation #1: To further aid understanding, consider providing participants with case study examples of incentive calculations to show pre-tax costs and how incentive amounts may change based on supplier quotes and/or equipment installed.                                     |
| Executive Summary | Recommendation #2: Ensure that support and handholding are available for participants who may need help navigating the program component and finding various contractors. Make technical guides available, providing general advice to help participants through the program component. |
| Executive Summary | Recommendation #3: Investigate the possibility of improving the audit reporting templates to improve time efficiencies for EAs, for example by streamlining the reports as much as possible.                                                                                            |
| Executive Summary | Recommendation #4: In the early stages of participant engagement, ensure that participants are aware of the co-financing options listed in E1's agreement.                                                                                                                              |

## Introduction

Could I please speak with <INSERT NAME>?

1. Yes **[GO TO INTRODUCTION]**
2. No / Not available **[SAY “Perhaps you can help me anyway.” GO TO INTRODUCTION]**

### **[INTRODUCTION]**

Hello, my name is \_\_\_\_\_ and I am calling from Narrative Research, a market research company. We are performing an evaluation of energy efficiency services provided by Efficiency Nova Scotia, and we have a survey today about the HomeWarming program that your household participated in this year. Are you the right person for us to speak with about your household’s participation in the program?

**(IF NEEDED:** The program offers building envelope upgrades, such as insulation and draft proofing, and heat pumps at no cost to eligible homeowners)

**(IF NEEDED:** The survey will take about 10 minutes.)

**[IF ASKED]** This survey is registered with the Canadian Research Insights Council (CRIC), and the survey code is INSERT CODE. You may visit the CRIC website to verify the research at: [canadianresearchinsightscouncil.ca/rvs/home/?lang=en](http://canadianresearchinsightscouncil.ca/rvs/home/?lang=en).

1. Yes **[CONTINUE]**
  2. No, does not recall participating **[PROBE:** “Are you sure? According to our records, you would have benefited from this Efficiency Nova Scotia program this year **[INSERT IF <MEASURE TYPE> = HP ONLY:** for the installation of a heat pump; **INSERT IF <MEASURE TYPE> = MODELLED:** for a home energy assessment and the installation of energy efficiency upgrades]. **[IF PERSIST AS ‘NO,’ THANK, TERMINATE, RECORD AND KEEP DATA]**
98. Don’t know/Refused **[PROBE:** “Is there someone else who would know about your household’s participation in the HomeWarming program?”] **[IF ‘YES,’ ASK TO SPEAK TO THE APPROPRIATE PERSON AND RESTART AT INTRODUCTION. IF PERSISTS AS ‘NO,’ THANK, TERMINATE, RECORD AND KEEP DATA.]**

**[IF REFUSED, ASK** “Can we schedule a more convenient time for you to conduct this survey?”]

**[SCHEDULED, IF NECESSARY, FOR:** \_\_\_\_\_]

Your responses are for research purposes only and will help improve the program. They will be combined with responses from others and used anonymously to prepare an evaluation report for Efficiency Nova Scotia. We will not use your information in a way that could identify you.

### **[RECORD FROM DATABASE: MEASURE TYPE]**

1. **[IF MEASURE CATEGORY = HP-ONLY]** Heat pump participants **[CHECK QUOTA AND CONTINUE]**
2. **[IF MEASURE CATEGORY = MODELLED]** Modelled participants (participant had a home energy assessment) **[CHECK QUOTA AND CONTINUE]**

### **[RECORD FROM DATABASE: “OHPA” YES OR NO]**

## A. Awareness of the Program

A1. a. How did you become aware of Efficiency Nova Scotia's HomeWarming program? **[DO NOT PROBE IF 98 IN 'a']** b. Anything else? **[DO NOT READ. MULTIPLE RESPONSES. PLEASE RECORD THE FIRST MENTION SEPARATELY FROM THE OTHERS]**

1. Efficiency Nova Scotia website
2. Insert in Nova Scotia Power bill
3. Online – general
4. Social media
5. Through participation in another Efficiency Nova Scotia program
6. Through a contractor
7. Word of mouth / Friends / Family
8. Efficiency Nova Scotia newsletter – online/email
9. Radio ads
10. Newspaper
11. TV ad
12. Brochure/handout
13. Special event like a home show
14. Community Energy Efficiency Program
15. Nova Scotia Government announcement
96. Other, please specify: \_\_\_\_\_
98. Don't know
99. Refused

A2. What was the main reason you were interested in participating in the HomeWarming program? **[DO NOT READ. ACCEPT ONLY ONE.]**

1. To save on energy/to save on energy costs
2. For environmental reasons
3. To make my home more comfortable
4. To get it for free
5. I was thinking about/planning to upgrade/needed to replace my heating system anyway
6. I was thinking about/planning to upgrade/needed to install insulation/draft proofing anyway
96. Other, please specify: \_\_\_\_\_
98. Don't know

## B. Satisfaction & Experience with the Program

The following series of questions will be focused on your satisfaction and experience with the HomeWarming program.

- B1. Using a 0 to 10 scale, where 0 is “definitely would not” and 10 is “definitely would”, what is the likelihood you would recommend the HomeWarming program to your family or friends?

Score /10: \_\_\_\_\_

98. (Don't know)

99. (Refused)

- B2. On a scale of 0 to 10, with 0 being “not at all satisfied” and 10 being “completely satisfied,” how satisfied are you with the program overall? **[RECORD NUMBER, 98=DON'T KNOW, 99=REFUSED] [DO NOT ACCEPT A RANGE]**

- B3. **[IF 0B2<8]** What was the main reason you were not more satisfied with the HomeWarming program overall? **[DO NOT READ. PROBE FOR SPECIFIC REASON. ACCEPT MULTIPLE RESPONSES, BUT RECORD FIRST AND SUBSEQUENT RESPONSES SEPARATELY. KEEP CODE 98 AND 99 EXCLUSIVES] PROBE:** Any other reasons?

1. I had to wait a long time between my application and the initial energy assessment
2. After the energy assessment, it took a long time for the proposed upgrades to be approved
3. It took a long time for the installation work to be completed
4. The process was long in general / the program took a long time to complete / long wait times
5. The information I received about the program was not clear
6. Difficulties completing the enrolment process
7. The initial home energy assessment did not go well
8. The low quality of interactions during program participation
9. Work done by the contractor was poor
10. The energy efficiency upgrades I received were not satisfactory
11. The final home energy assessment did not go well
96. Other, please specify \_\_\_\_\_
98. Don't know
99. Refused

- B4. On a scale of 0 to 10, where 0 is 'not at all satisfied' and 10 is 'completely satisfied', how satisfied were you with each of the following aspects of the program? **[RANDOMIZE] [RECORD NUMBER, 98=DON'T KNOW, 99= REFUSED] [DO NOT ACCEPT A RANGE]**
1. The way you enroll in the program
  2. The information you received about the different steps in the program
  3. **[ASK < MEASURE CATEGORY = MODELLED]** The wait time between your enrolment and the initial home energy evaluation assessment
  4. **[ASK < MEASURE CATEGORY = MODELLED]** The initial home energy assessment provided by the Energy Auditor
  5. **[ASK < MEASURE CATEGORY = MODELLED]** The wait time between the energy assessment and the installation work being completed
  6. The quality of the product(s) installed in your home
  7. The quality of the installation work
  8. The information you received about the product(s) installed
  9. **[ASK IF < MEASURE CATEGORY = HP ONLY]** The information you received about how to use your heat pump
- B5. On a scale of 0 to 10, where 0 is 'not at all satisfied' and 10 is 'completely satisfied', how satisfied were you with the interactions you had during your participation in the process? **[RANDOMIZE] [RECORD NUMBER, 98=DON'T KNOW, 99= REFUSED] [DO NOT ACCEPT A RANGE]**
1. Interactions and communications with the contractor **[INSERT <PRIMARY CONTRACTOR>]** who you were in contact with to schedule appointments and organize the installation of the upgrade(s)
  2. **[ASK < MEASURE CATEGORY = MODELLED]** Interactions with the Energy Auditor that conducted the home energy assessment
  3. The service provided by those responsible for installing the upgrade(s)(e.g., contractors, subcontractors...)
- B6. On a scale of 0 to 10, where 0 is 'do not agree at all' and 10 is 'completely agree', what is your level of agreement with the following statements? **[RANDOMIZE] [RECORD NUMBER, 95= NOT APPLICABLE, 98=DON'T KNOW, 99= REFUSED] [DO NOT ACCEPT A RANGE]**
1. **[ASK IF < MEASURE CATEGORY = MODELLED]** I learned about my home's energy usage during the initial Home Energy assessment
  2. **[ASK IF < MEASURE CATEGORY = MODELLED]** I received all the energy efficiency upgrades I expected to receive after the Home Energy assessment
  3. I received information about the products installed
  4. **[ASK IF < MEASURE CATEGORY = HP-ONLY]** I understand how to operate and maintain the equipment that was installed by this program
  5. It was easy to participate in the HomeWarming program
  6. It was worthwhile participating in the HomeWarming program

## C. Benefits and challenges

The following series of questions will be focused on the benefits you received and challenges you may have experienced from participating in the Home Warming program.

- C1. On a scale of 0 to 10, where 0 is “do not agree at all” and 10 is “completely agree”, what is your level of agreement with the following statements? **[RANDOMIZE] [98 = DON'T KNOW, 99 = REFUSED]**
1. My home is more comfortable because of the energy efficient upgrades I received
  2. I am spending less money to heat my home
  3. I am now able to utilize additional space(s) in my home after participating in this program
  4. After participating in the program, I can keep my home warmer in the winter
- C2. Apart from what you have already mentioned, did you experience any other benefits with the program?
1. Yes
  2. No **[SKIP to C4]**
- C3. What other benefits did you experience thanks to the program? **[OPEN END]**
- C4. And, other than those you already mentioned, did you experience any other issues?
1. Yes
  2. No **[SKIP to D1]**
- C5. What other issues or challenges did you have with the program? **[OPEN END – ONE LINE PER SEPARATE ISSUE]**
98. (Don't Know)
99. (Refused)

## D. Opportunities for Improvement

The following series of questions will be focused on improving the HomeWarming program.

- D1. **[ASK IF < MEASURE CATEGORY = MODELLED >]** What questions, if any, do you have about the different upgrades installed through the Home Warming program? **[TEXT BOX, 97=NOTHING/ALL IS GOOD, 98=DON'T KNOW] [OPEN END]**
- D2. **[ASK IF < MEASURE CATEGORY = HP-ONLY>]** What questions, if any, do you have about the heat pump installed through the Home Warming program? **[TEXT BOX, 97=NOTHING/ALL IS GOOD, 98=DON'T KNOW] [OPEN END]**

- D3. **[ASK IF RESPONDENT HAS QUESTIONS AT D1 OR D2]** How would you prefer those questions to be answered? **[READ. RANDOMIZE. MULTIPLE RESPONSES POSSIBLE]**
1. Over the phone with the contractor **[INSERT <PRIMARY CONTRACTOR>]** you've been dealing with throughout the program
  2. Having a dedicated number to call
  3. Through leaflets and education materials that the contractor/installer/inspector can leave behind
  4. Through an online chat service
  5. On a dedicated website with frequently asked questions about the program
  96. Other (specify)
  97. **[EXCLUSIVE]** Nothing/ All is good
  98. **[EXCLUSIVE]** Don't know
- D4. Is there any other information you would have liked to know about the program before going through it? **[TEXT BOX, 97=NOTHING/ALL IS GOOD, 98=DON'T KNOW]**
- D5. What recommendations do you have for improving the HomeWarming program? **[DO NOT READ. MULTIPLE RESPONSES]**
1. Have more upgrades available
  2. Simpler/ easier process/enrolment
  3. More information on the program
  4. More information about the installed products
  5. More information about how to operate the heat pump
  6. Better quality of installed products
  7. Improved interaction and communication with stakeholders
  8. Improved wait times
  96. Other, please specify \_\_\_\_\_
  97. **[EXCLUSIVE]** Nothing/ All is good
  98. **[EXCLUSIVE]** Don't know

## E. Demographics

These final questions are asked for statistical purposes only. The information collected is strictly confidential.

- E1. What type of residence do you live in? **[READ RESPONSES 1-5 IN ORDER, THEN 96; SELECT ONE RESPONSE]**
1. Detached single-family home
  2. Semi-detached house
  3. Mobile home or house trailer
  4. Townhouse or duplex which share adjacent walls
  5. Row house
  96. Other, please specify \_\_\_\_\_
  98. (Don't know)
  99. (Refused)
- E2. Please indicate the town or city where your primary residence is located: \_\_\_\_\_  
**[To code URBAN/RURAL on back-end]**
- E3. Including yourself, how many people live in this residence on a full-time basis?
- Number of people: \_\_\_\_\_ **[NOTE: DON'T ALLOW ZERO FOR A RESPONSE]**
97. Nobody lives in the house on a full-time basis
  99. (Refused)
- E4. What is your age group? Are you ....: **[READ; STOP WHEN ANSWER IS VOLUNTEERED]**
1. 18 to 24
  2. 25 to 34
  3. 35 to 44
  4. 45 to 54
  5. 55 to 64
  6. 65 or over
  99. (Refused)
- E5. What is the highest level of education you have completed? **[READ IF NECESSARY]**
1. Less than high school graduation diploma
  2. High school graduation diploma and/or some post secondary
  3. Trade certificate or diploma
  4. College certificate or diploma
  5. University degree, certificate or diploma
  96. Other, please specify: \_\_\_\_\_
  99. (Refused)

E6. What is your gender?

1. Male
2. Female
3. Non-binary
4. Another gender (Please specify this gender if you are comfortable doing so: \_\_\_\_\_)
5. Prefer not to say

**END:** Those are all the questions I have for you. I thank you very much for your time and cooperation and have a nice day.

## APPENDIX VIII

### ASFH Participant Survey Results

The participant survey results are presented in the following tables.

#### A. Awareness of the Program

A1. How did you become aware of Efficiency Nova Scotia's HomeWarming program? Anything else?

|                                                                 | Overall % | Measure Category |            |
|-----------------------------------------------------------------|-----------|------------------|------------|
|                                                                 |           | Modelled%        | Heat Pump% |
| <b>Sample Size (#)</b>                                          | <b>52</b> | <b>22</b>        | <b>30</b>  |
| Word of mouth/friends/family                                    | 37%       | 36%              | 37%        |
| Online – general                                                | 31%       | 23%              | 37%        |
| Social media                                                    | 21%       | 41%              | 7%         |
| TV ad                                                           | 13%       | 18%              | 10%        |
| Efficiency Nova Scotia newsletter – online/email                | 10%       | 5%               | 13%        |
| Newspaper                                                       | 8%        | 9%               | 7%         |
| Through participation in another Efficiency Nova Scotia program | 4%        | 0%               | 7%         |
| Brochure/handout                                                | 4%        | 0%               | 7%         |
| Insert in Nova Scotia Power bill                                | 4%        | 9%               | 0%         |
| Nova Scotia Government announcement                             | 2%        | 5%               | 0%         |
| Efficiency Nova Scotia website                                  | 2%        | 5%               | 0%         |
| Other                                                           | 8%        | 0%               | 13%        |
| Don't know                                                      | 4%        | 0%               | 7%         |

A2. What was the main reason you were interested in participating in the HomeWarming program?

|                                                                                             | Overall % | Measure Category |            |
|---------------------------------------------------------------------------------------------|-----------|------------------|------------|
|                                                                                             |           | Modelled%        | Heat Pump% |
| <b>Sample Size (#)</b>                                                                      | <b>52</b> | <b>22</b>        | <b>30</b>  |
| To save on energy/to save on energy costs                                                   | 54%       | 59%              | 50%        |
| I was thinking about/planning to upgrade/needed to replace my heating system anyway         | 12%       | 18%              | 13%        |
| I was thinking about/planning to upgrade/needed to install insulation/draft proofing anyway | 12%       | 9%               | 7%         |
| To get it for free                                                                          | 6%        | 0%               | 10%        |
| For environmental reasons                                                                   | 8%        | 5%               | 10%        |
| To make my home more comfortable                                                            | 6%        | 9%               | 3%         |
| Other                                                                                       | 2%        | 0%               | 3%         |
| Don't know                                                                                  | 2%        | 0%               | 3%         |

## B. Satisfaction & Experience with the Program

B1. Using a 0 to 10 scale, where 0 is “definitely would not” and 10 is “definitely would”, what is the likelihood you would recommend the HomeWarming program to your family or friends?

|                                                                                      | Overall % | Measure Category |            |
|--------------------------------------------------------------------------------------|-----------|------------------|------------|
|                                                                                      |           | Modelled%        | Heat Pump% |
| <b>Sample Size (#)</b>                                                               | <b>52</b> | <b>22</b>        | <b>30</b>  |
| 10 - Definitely would                                                                | 79%       | 82%              | 77%        |
| 9                                                                                    | 6%        | 0%               | 10%        |
| 8                                                                                    | 10%       | 9%               | 10%        |
| 7                                                                                    | 4%        | 5%               | 3%         |
| 6                                                                                    | 2%        | 5%               | 0%         |
| 5                                                                                    | 0%        | 0%               | 0%         |
| 4                                                                                    | 0%        | 0%               | 0%         |
| 3                                                                                    | 0%        | 0%               | 0%         |
| 2                                                                                    | 0%        | 0%               | 0%         |
| 1                                                                                    | 0%        | 0%               | 0%         |
| 0 - Definitely would not                                                             | 0%        | 0%               | 0%         |
| Don't know                                                                           | 0%        | 0%               | 0%         |
| Refused                                                                              | 0%        | 0%               | 0%         |
| TOP 3 BOX % (ratings of 8,9,10)                                                      | 94%       | 91%              | 97%        |
| MIDDLE 3 BOX % (ratings of 5,6,7)                                                    | 6%        | 9%               | 3%         |
| BOTTOM 5 BOX % (ratings of 0,1,2,3,4)                                                | 0%        | 0%               | 0%         |
| MEAN                                                                                 | 9.6       | 9.5              | 9.6        |
| Note: Responses of 'Don't know' and 'Refused' are excluded from the mean calculation |           |                  |            |

B2. On a scale of 0 to 10 scale, with 0 being “not at all satisfied” and 10 being “completely satisfied,” how satisfied are you with the program overall?

|                                                                                      | Overall % | Measure Category |            |
|--------------------------------------------------------------------------------------|-----------|------------------|------------|
|                                                                                      |           | Modelled%        | Heat Pump% |
| <b>Sample Size (#)</b>                                                               | <b>52</b> | <b>22</b>        | <b>30</b>  |
| 10 - Completely satisfied                                                            | 67%       | 64%              | 70%        |
| 9                                                                                    | 8%        | 0%               | 13%        |

D4. Is there any other information you would have liked to know about the program before going through it?

|                                                | Overall % | Measure Category |            |
|------------------------------------------------|-----------|------------------|------------|
|                                                |           | Modelled%        | Heat Pump% |
| <b>Sample Size (#)</b>                         | <b>52</b> | <b>22</b>        | <b>30</b>  |
| Nothing/All is good                            | 83%       | 82%              | 83%        |
| More information in general about the programs | 10%       | 18%              | 3%         |
| More efficiency upgrade options                | 2%        | 0%               | 3%         |
| Other                                          | 6%        | 0%               | 10%        |

D5. What recommendations do you have for improving the HomeWarming program?

|                                                          | Overall % | Measure Category |            |
|----------------------------------------------------------|-----------|------------------|------------|
|                                                          |           | Modelled%        | Heat Pump% |
| <b>Sample Size (#)</b>                                   | <b>52</b> | <b>22</b>        | <b>30</b>  |
| Improved interaction and communication with stakeholders | 12%       | 23%              | 3%         |
| Have more upgrades available                             | 10%       | 9%               | 10%        |
| Improved wait times                                      | 8%        | 14%              | 3%         |
| More information about the installed products            | 8%        | 14%              | 3%         |
| More information on the program                          | 6%        | 5%               | 7%         |
| More advertising/Increase awareness of the program       | 4%        | 0%               | 7%         |
| Simpler/easier process/enrolment                         | 4%        | 9%               | 0%         |
| Better quality of installed products                     | 2%        | 0%               | 3%         |
| More information about how to operate the heat pump      | 2%        | 0%               | 3%         |
| Other                                                    | 12%       | 14%              | 10%        |
| Nothing/All is good                                      | 48%       | 36%              | 57%        |
| Don't know                                               | 2%        | 0%               | 3%         |

## E. Demographics

E1. What type of residence do you live in?

|                                                | Overall % | Measure Category |            |
|------------------------------------------------|-----------|------------------|------------|
|                                                |           | Modelled%        | Heat Pump% |
| <b>Sample Size (#)</b>                         | <b>52</b> | <b>22</b>        | <b>30</b>  |
| Detached single-family home                    | 75%       | 91%              | 63%        |
| Semi-detached house                            | 4%        | 0%               | 7%         |
| Mobile home or house trailer                   | 15%       | 9%               | 20%        |
| Townhouse or duplex which share adjacent walls | 6%        | 0%               | 10%        |

E2. Please indicate the town or city where your primary residence is located: CODED INTO URBAN/RURAL

|                        | Overall % | Measure Category |            |
|------------------------|-----------|------------------|------------|
|                        |           | Modelled%        | Heat Pump% |
| <b>Sample Size (#)</b> | <b>52</b> | <b>22</b>        | <b>30</b>  |
| Urban                  | 44%       | 23%              | 60%        |
| Rural                  | 54%       | 73%              | 40%        |
| Unspecified            | 2%        | 5%               | 0%         |

E3. Including yourself, how many people live in this residence on a full-time basis?

|                        | Overall % | Measure Category |            |
|------------------------|-----------|------------------|------------|
|                        |           | Modelled%        | Heat Pump% |
| <b>Sample Size (#)</b> | <b>52</b> | <b>22</b>        | <b>30</b>  |
| 1                      | 27%       | 32%              | 23%        |
| 2                      | 58%       | 50%              | 63%        |
| 3                      | 8%        | 9%               | 7%         |
| 4                      | 2%        | 5%               | 0%         |
| 5                      | 2%        | 0%               | 3%         |
| 6                      | 4%        | 5%               | 3%         |

E4. What is your age group? Are you ....:

|                        | Overall % | Measure Category |            |
|------------------------|-----------|------------------|------------|
|                        |           | Modelled%        | Heat Pump% |
| <b>Sample Size (#)</b> | <b>52</b> | <b>22</b>        | <b>30</b>  |
| 18 to 24               | 2%        | 0%               | 3%         |
| 25 to 34               | 2%        | 0%               | 3%         |
| 35 to 44               | 10%       | 9%               | 10%        |
| 45 to 54               | 12%       | 14%              | 10%        |
| 55 to 64               | 17%       | 23%              | 13%        |
| 65 or over             | 58%       | 55%              | 60%        |

E5. What is the highest level of education you have completed?

|                                                             | Overall % | Measure Category |            |
|-------------------------------------------------------------|-----------|------------------|------------|
|                                                             |           | Modelled%        | Heat Pump% |
| <b>Sample Size (#)</b>                                      | <b>52</b> | <b>22</b>        | <b>30</b>  |
| (Less than high school graduation diploma)                  | 17%       | 14%              | 20%        |
| (High school graduation diploma and/or some post secondary) | 38%       | 41%              | 37%        |
| (Trades certificate or diploma)                             | 10%       | 9%               | 10%        |
| (College certificate or diploma)                            | 17%       | 18%              | 17%        |
| (University degree, certificate or diploma)                 | 15%       | 14%              | 17%        |
| (Refused)                                                   | 2%        | 5%               | 0%         |

E6. What is your gender?

|                        | Overall % | Measure Category |            |
|------------------------|-----------|------------------|------------|
|                        |           | Modelled%        | Heat Pump% |
| <b>Sample Size (#)</b> | <b>52</b> | <b>22</b>        | <b>30</b>  |
| Male                   | 35%       | 32%              | 37%        |
| Female                 | 65%       | 68%              | 63%        |

## APPENDIX IX

### ASFH Heat Pump Contractor Interview Guide

#### AFFORDABLE SINGLE-FAMILY HOMES (ASFH) PROGRAM EVALUATION

#### GUIDE FOR INTERVIEWS WITH HP CONTRACTORS

Table 1: Overview of Data Collection Activity

| Descriptor                      | This Instrument                  |
|---------------------------------|----------------------------------|
| Instrument Type                 | Semi-directed in-depth interview |
| Estimated Time to Complete      | 20-25 minutes                    |
| Target Audience                 | Contractors                      |
| Expected Number of Completions  | 2 large<br>2 small               |
| Contact List Source             | Efficiency One                   |
| Fielding Firm                   | Narrative Research               |
| Estimated Timeline for Fielding | October/November 2024            |

Table 2: Research Objectives and Associated Questions

| Research Questions                     | Question # |
|----------------------------------------|------------|
| Respondent Involvement in the Program  | B1-B5      |
| Program Strengths and Challenges       | C1-C11     |

## Introduction

Hello, may I speak with **[Contact name]**?

My name is **[Interviewer name]** and I'm calling from Narrative Research, a market research firm. Efficiency One has mandated the evaluation of its HomeWarming Program, which provides building envelope upgrades, such as insulation and draft proofing, and heat pumps at no cost to eligible homeowners. Efficiency Nova Scotia has informed us that **[BUSINESS NAME]** has participated in the program, and we are interested in your opinion from your perspective as a contractor. Are you the person most familiar with **[BUSINESS NAME]**'s involvement in the program? Our discussion should last about 20-25 minutes.

### A. Identification and Screening of Respondent

- › Person responsible available **[CONTINUE]**
- › Person responsible currently unavailable **[ARRANGE CALL BACK WITH THE RIGHT PERSON]**
- › Don't know **[ASK TO SPEAK TO ANOTHER PERSON WHO WOULD KNOW ABOUT THE PROGRAM]**
- › Refused **[THANK AND TERMINATE]**
- › Do you have any questions before we start?

### B. Respondent Involvement in the Program

- B1. To begin, what is your title, and could you briefly describe your company and your role and responsibilities?
- B2. How long have you been completing heat pump projects for Efficiency Nova Scotia as part of the HomeWarming program?
- B3. Approximately how many heat pump projects do you complete each year under the HomeWarming program?

### C. Program Strengths and Challenges

Now, I would like to discuss the HomeWarming program – heat pump delivery process with you. In general, we understand that a project includes the following steps: **[READ]**The contractor receives information about interested participants from the Efficiency Nova Scotia HomeWarming/Heat pump team.

1. The contractor receives information about interested participants from the Efficiency Nova Scotia HomeWarming.
2. The contractor contacts the participant to schedule an appointment to size the heat pump.
3. The contractor conducts the initial visit with participants to size the heat pump.
4. After the initial visit, the contractor submits the proposed heat pump and required photos, forms and details to Efficiency Nova Scotia for review.
5. Efficiency Nova Scotia reviews and approves the proposed heat pump.
6. The contractor informs the participant of approval and organizes and completes the installation of the heat pump.
7. Finally, the contractor invoices Efficiency Nova Scotia for the service and gets paid.

- C1. Is my understanding of the heat pump delivery process, correct? **[RECTIFY WHERE NECESSARY]**
- C2. For each of the program steps, I'd like to know what is working well, what issues have been faced – both for you as the contractor and for participants when relevant, and what improvements could be made.

**[ASK FOR EVERY STEP]**

- h. What is working well for you?
- (i) What problems or issues, if any, have you faced?
- (ii) What is working well for participants?
- (iii) What problems or issues, if any, have participants faced?
- (iv) What could be improved?

| Steps |                                                                                                                                                     | (a)<br>Problems Faced<br>by DAs         | (b)<br>Working Well<br>for DAs         | (c)<br>Problems Faced<br>by Participants | (d)<br>Working Well for<br>Participants | (e)<br>What could be<br>improved? | ASK IF NOT COVERED                                                             |
|-------|-----------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------|----------------------------------------|------------------------------------------|-----------------------------------------|-----------------------------------|--------------------------------------------------------------------------------|
| 1     | The contractor receives information about interested participants from the Efficiency Nova Scotia HomeWarming                                       |                                         |                                        |                                          |                                         |                                   |                                                                                |
| 2     | The contractor contacts the participant to schedule an appointment to size the heat pump.                                                           |                                         |                                        |                                          |                                         |                                   |                                                                                |
| 3     | The contractor conducts the initial visit with participants to size the heat pump.                                                                  |                                         |                                        |                                          |                                         |                                   |                                                                                |
| 4     | After the initial visit, the contractor submits the proposed heat pump and required photos, forms and details to Efficiency Nova Scotia for review. |                                         |                                        |                                          |                                         |                                   |                                                                                |
| Steps |                                                                                                                                                     | (a)<br>Problems Faced<br>by contractors | (b)<br>Working Well<br>for contractors | (c)<br>Problems Faced<br>by Participants | (d)<br>Working Well for<br>Participants | (e)<br>What could be<br>improved? | ASK IF NOT COVERED                                                             |
| 5     | Efficiency Nova Scotia reviews and approves the proposed heat pump.                                                                                 |                                         |                                        |                                          |                                         |                                   | (f) Under what circumstances does Efficiency Nova Scotia not approve the work? |
| 6     | The contractor informs the participant of approval and organizes and completes the installation of the heat pump.                                   |                                         |                                        |                                          |                                         |                                   |                                                                                |
| 7     | Finally, the contractor invoices Efficiency Nova Scotia for the service and gets paid.                                                              |                                         |                                        |                                          |                                         |                                   |                                                                                |

- C3. What questions, if any, do program participants ask you about heat pump technology, or about how it works?
- C4. What other questions, if any, do participants have about energy efficiency?
- C5. After completing the upgrades, do you let homeowners know how to operate and maintain their heat pump or about the potential benefits of heat pumps? Do you leave any information or documents behind with them?
- C6. How strongly do you agree with the following statements? Please use a 1 to 10 scale, where 1 means “completely disagree” and 10 means “completely agree”.
- (i) It is easy to deliver Efficiency Nova Scotia’s HomeWarming program.
  - (ii) It is worthwhile being involved in the delivery of Efficiency Nova Scotia’s HomeWarming program.

## D. Program Effectiveness and Satisfaction

Now, I would like to discuss your satisfaction with the HomeWarming program.

- D1. On a scale of 0 to 10, where 0 is “not at all satisfied” and 10 is “completely satisfied”, how would you rate your satisfaction with each of the following six aspects of the HomeWarming Program  
[ASK FOR REASON IF 7 OR LOWER]

| Aspects of the Program                                                            | Score<br>0 = Not at all satisfied<br>10 = Completely Satisfied | Reason<br>If 7 or less, please share the reason(s) for your score. |
|-----------------------------------------------------------------------------------|----------------------------------------------------------------|--------------------------------------------------------------------|
| a. The overall program                                                            | --/10                                                          | What could be improved?                                            |
| b. The selection of heat pumps eligible for the program                           | --/10                                                          | What could be improved?                                            |
| c. The quality of the product(s) installed                                        | --/10                                                          | What could be improved?                                            |
| d. The effectiveness of communications with Efficiency Nova Scotia                | --/10                                                          | What could be improved?                                            |
| e. The marketing materials and tools provided by Efficiency Nova Scotia           | --/10                                                          | What could be improved?                                            |
| f. The data/record keeping process and reporting to Efficiency Nova Scotia        | --/10                                                          | What could be improved?                                            |
| g. The benefits resulting from being an Efficiency Preferred Partner (EPP) Member | --/10                                                          | What could be improved?                                            |
| h. The user-friendliness of the customer information system                       | --/10                                                          | What could be improved?                                            |

## E. Suggestions for Improvements

- E1. What additional support, tools, or training could Efficiency Nova Scotia provide to help make your job easier?
- E2. **[IF SUPPORT MENTIONED AT E1]** How would you like Efficiency Nova Scotia to deliver this support to you? **[PROBE: webinar, lunch-and-learn session...]**
- E3. What information, tools, or support could Efficiency Nova Scotia provide you to help you educate or inform participants about heat pump technology or how to use heat pumps efficiently?
- E4. What other suggestions do you have for improving the HomeWarming Program?
- E5. Using a 0 to 10 scale, where 0 is “definitely would not” and 10 is “definitely would”, what is the likelihood you would recommend the HomeWarming program to your family or friends?
- Score /10: \_\_\_\_\_
98. (Don't know)
- (b) (Refused)
- E6. And finally, do you have any other comments about the HomeWarming Program?

Thank you very much for your time and collaboration today!

**END**

## Introduction

Hello, may I speak with **[CONTACT NAME]**?

My name is **[INTERVIEWER NAME]** and I'm calling from Econoler on behalf of Efficiency Nova Scotia.

Efficiency Nova Scotia is evaluating its HomeWarming Program. They let us know that you are a delivery agent for this program, and we are interested in your opinion regarding the program from the delivery agent perspective. Are you the person most familiar with **[INSERT DA NAME]**'s involvement in the HomeWarming program?

Do you have any questions before we start?

**[IF ASKED]** The interview should take about 30 minutes.

### A. Respondent Involvement in the Program

First, I would like to know more about your background and involvement with the program.

A1. Please tell me your title and briefly describe your role in the HomeWarming Program.

### B. Program Delivery

Now, I would like to discuss the HomeWarming program delivery process with you. In general, we understand that a project includes the following steps: **[READ]**

1. The delivery agent (DA) receives information about interested participants from the Efficiency Nova Scotia HomeWarming team.
2. The DA contacts the participant to schedule an appointment to complete the energy assessment or size the heat pump.
3. The DA conducts the initial visit with participants. If an energy assessment is being conducted, the DA models the home using HOT2000.
4. After the initial visit, the DA submits the proposed upgrades and required photos, forms and details to Efficiency Nova Scotia for review.
5. Efficiency Nova Scotia reviews and approves the proposed upgrades.
6. The DA informs the participant of approval and what upgrades are available. Then, the participant has the right to refuse any or all upgrades.
7. The DA organizes and completes the installation of the upgrades.
8. The DA conducts the final energy assessment, if applicable, and submits the details to Efficiency Nova Scotia.
9. Finally, the DA invoices Efficiency Nova Scotia for the service and gets paid.

- B1. Is my understanding of the HomeWarming delivery process, correct? **[RECTIFY WHERE NECESSARY]**
- B2. For each of the program steps, I'd like to know what is working well, what issues have been faced – both for you as the delivery agent and for participants when relevant, and what improvements could be made.

**[ASK FOR EVERY STEP]**

- a. What is working well for you?
- b. What problems or issues, if any, have you faced?
- c. What is working well for participants?
- d. What problems or issues, if any, have participants faced?
- e. What could be improved?

| Steps |                                                                                                                                                | (a)<br>Problems<br>Faced by<br>DAs | (b)<br>Working<br>Well for<br>DAs | (c)<br>Problems<br>Faced by<br>Participants | (d)<br>Working Well<br>for<br>Participants | (e)<br>What could<br>be improved? | ASK IF NOT COVERED                                                             |
|-------|------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------|-----------------------------------|---------------------------------------------|--------------------------------------------|-----------------------------------|--------------------------------------------------------------------------------|
| 1     | The delivery agent (DA) receives information about interested participants from the Efficiency Nova Scotia HomeWarming team.                   |                                    |                                   |                                             |                                            |                                   |                                                                                |
| 2     | The DA contacts the participant to schedule an appointment to complete the energy assessment or size the heat pump.                            |                                    |                                   |                                             |                                            |                                   |                                                                                |
| 3     | The DA conducts the initial visit with participants. If an energy assessment is being conducted, the DA models the home using HOT2000.         |                                    |                                   |                                             |                                            |                                   |                                                                                |
| 4     | After the initial visit, the DA submits the proposed upgrades and required photos, forms and details to Efficiency Nova Scotia for review.     |                                    |                                   |                                             |                                            |                                   |                                                                                |
| Steps |                                                                                                                                                | (a)<br>Problems<br>Faced by<br>DAs | (b)<br>Working<br>Well for<br>DAs | (c)<br>Problems<br>Faced by<br>Participants | (d)<br>Working Well<br>for<br>Participants | (e)<br>What could<br>be improved? | ASK IF NOT COVERED                                                             |
| 5     | Efficiency Nova Scotia reviews and approves the proposed upgrades.                                                                             |                                    |                                   |                                             |                                            |                                   | (f) Under what circumstances does Efficiency Nova Scotia not approve the work? |
| 6     | The DA informs the participant of approval and what upgrades are available. Then, the participant has the right to refuse any or all upgrades. |                                    |                                   |                                             |                                            |                                   |                                                                                |
| 7     | The DA organizes and completes the installation of the upgrades.                                                                               |                                    |                                   |                                             |                                            |                                   |                                                                                |
| 8     | The DA conducts the final energy assessment, if applicable, and submits the details to Efficiency Nova Scotia.                                 |                                    |                                   |                                             |                                            |                                   |                                                                                |
| 9     | Finally, the DA invoices Efficiency Nova Scotia for the service and gets paid.                                                                 |                                    |                                   |                                             |                                            |                                   |                                                                                |

- B3. What questions do participants have about energy efficiency or about the different upgrades being installed in their home?
- B4. Are there any other issues or challenges with the HomeWarming Program we haven't mentioned?
- B5. How strongly do you agree with the following statements? Please use a 1 to 10 scale, where 1 means "completely disagree" and 10 means "completely agree".
- (i) It is easy to deliver Efficiency Nova Scotia's HomeWarming program.
  - (ii) It is worthwhile being involved in the delivery of Efficiency Nova Scotia's HomeWarming program.

## C. Satisfaction

Now I would like to discuss your satisfaction with the program.

- C1. On a scale of 1 to 10, where 1 is "not at all satisfied" and 10 is "completely satisfied", how satisfied are you with each of these aspects of the HomeWarming Program. **[ASK FOR REASON IF 7 OR LOWER]**

| Aspects of the Program                                                     | Score<br>0 = Not at all<br>satisfied<br>10 = Completely<br>Satisfied | Reason<br>If 7 or less, please share the<br>reason(s) for your score. |
|----------------------------------------------------------------------------|----------------------------------------------------------------------|-----------------------------------------------------------------------|
| a. The HomeWarming program overall                                         | --/10                                                                | What could be improved?                                               |
| b. HW participation levels                                                 | --/10                                                                | What could be improved?                                               |
| c. The range of upgrades included in the HW program                        | --/10                                                                | What could be improved?                                               |
| d. The quality of the product(s) installed                                 | --/10                                                                | What could be improved?                                               |
| e. The effectiveness of your communications with EfficiencyOne             | --/10                                                                | What could be improved?                                               |
| f. The marketing materials and tools provided by Efficiency Nova Scotia    | --/10                                                                | What could be improved?                                               |
| g. The data/record keeping process and reporting to Efficiency Nova Scotia | --/10                                                                | What could be improved?                                               |
| h. The user-friendliness of the customer information system                | --/10                                                                | What could be improved?                                               |

## D. Improvements and Opportunities

- D1. Apart from what you have already mentioned, what other suggestions do you have for improving the HomeWarming program, if any?
- D2. **[IF NOT ALREADY MENTIONED]** What additional support, tools, or training could Efficiency Nova Scotia provide to help make your job easier?
- D3. **[IF NOT ALREADY MENTIONED]** What information, tools, or support could Efficiency Nova Scotia provide you to help you educate or inform participants about upgrades efficiently?

D4. Is there anything else you'd like to mention about the program?

## **E. End of Interview**

That is all the questions I have. Thank you for your time.

## APPENDIX XI

### ASFH Tracking Sheet Audit

This appendix presents the main results of the tracking sheet audit performed by the Evaluator, which was aimed at:

- › Verifying that all data fields required for the evaluation were included and filled out in the tracking sheet submitted by E1
- › Ensuring that tracked results were accurate by:
  - › Verifying that parameters used to calculate program results (gross and net energy and peak demand savings at the generator) were consistent with previous evaluation results
  - › Validating that all calculation steps were performed consistently

Table 1 presents the corrected tracked savings resulting from all changes made by the Evaluator.

**Table 1: 2024 ASFH Corrected Tracked Savings**

| Program Component Result                   | Value Tracked by E1 |      | Corrected Tracked Value |      | Relative Difference |
|--------------------------------------------|---------------------|------|-------------------------|------|---------------------|
|                                            | Value               | Unit | Value                   | Unit | Value               |
| <b>Modelled Measures</b>                   |                     |      |                         |      |                     |
| Gross Energy Savings at the Generator      | 4.758               | GWh  | 4.635                   | GWh  | -2.58%              |
| Gross Peak Demand Savings at the Generator | 2.157               | MW   | 2.150                   | MW   | -0.36%              |
| Net Energy Savings at the Generator *      | 4.758               | GWh  | 4.635                   | GWh  | -2.58%              |
| Net Peak Demand Savings at the Generator * | 2.157               | MW   | 2.150                   | MW   | -0.36%              |
| <b>Non-modelled Measures</b>               |                     |      |                         |      |                     |
| Gross Energy Savings at the Generator      | 0.050               | GWh  | 0.058                   | GWh  | 14.8%               |
| Gross Peak Demand Savings at the Generator | 0.009               | MW   | 0.010                   | MW   | 11.6%               |
| Net Energy Savings at the Generator *      | 0.050               | GWh  | 0.058                   | GWh  | 14.8%               |
| Net Peak Demand Savings at the Generator * | 0.009               | MW   | 0.010                   | MW   | 11.6%               |
| <b>ASFH Total</b>                          |                     |      |                         |      |                     |
| Gross Energy Savings at the Generator      | 4.808               | GWh  | 4.693                   | GWh  | -2.39%              |
| Gross Peak Demand Savings at the Generator | 2.167               | MW   | 2.160                   | MW   | -0.31%              |
| Net Energy Savings at the Generator *      | 4.808               | GWh  | 4.693                   | GWh  | -2.39%              |
| Net Peak Demand Savings at the Generator * | 2.167               | MW   | 2.160                   | MW   | -0.31%              |

\* Net savings are not included as a separate value in the tracking sheet since net savings are equal to gross savings.

The differences between the tracked and corrected energy savings of modelled measures were due to correcting the overestimation ratios, line loss factors, or unitary savings for a few projects as well as the use of a different calculation approach by E1 for a few entries, notably a new calculation approach for non-modeled heat pumps, which the Evaluator recalculated using the same calculation approach as in the 2023 evaluation.

The differences between the tracked and corrected peak demand savings of modelled measures were slightly smaller. These were due to the Evaluator and E1 using slightly different calculation approaches in some instances. In addition, the same issues as for energy savings were also observed. These differences were a mix of upward and downward adjustments that partly cancelled each other.

The differences between the tracked and corrected energy peak demand savings of non-modelled measures were due to the Evaluator using the unitary savings values established as part of the 2023 evaluation while older values were used by E1.

## APPENDIX XII

### ASFH 2024 Recommendations

This appendix summarizes all the recommendations made by the Evaluator as part of the 2024 ASFH evaluation.

| Section           | Recommendations                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Executive Summary | Recommendation #1: To assess progress with participant wait times, E1 could track wait times as well as program delivery satisfaction levels (e.g. in quarterly customer satisfaction surveys) throughout 2025 to determine how strategies are performing and make adjustments if necessary.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Executive Summary | <p>Recommendation #2: Provide participants with more information about ASFH to help them understand program options, eligible measures, and participation steps by implementing the following:</p> <ul style="list-style-type: none"> <li>a) Investigate ways to inform participants about eligible measures in ASFH and to ensure that other program options and their differences (i.e. Oil to Heat Pump Affordability [OHPA]) are clearly presented to participants verbally and through marketing materials.</li> <li>b) Review the application template for clarity and adapt it to confirm with participants to which program they are applying (i.e. ASFH, OHPA). Ensure that the information in the application is shared with DAs/contractors.</li> <li>c) Once participants have submitted their application, clearly communicate (perhaps using a visual) the touchpoints that will occur along their journey (e.g. who will be contacting them, at what point, and what to expect).</li> </ul> |
| Executive Summary | Recommendation #3: Reinforce participant awareness of the Energy Solution Advisor's role as E1 program navigator to help participants better understand and navigate E1's programs (including ASFH).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Executive Summary | Recommendation #4: To maximize energy savings, ensure that all participants receive the necessary information to operate and maintain the equipment installed in language that is easy to understand. Implement checklists for DAs and heat pump contractors if necessary.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Executive Summary | Recommendation #5: Ensure that DAs/contractors provide a leave-behind so that participants know who to contact in case of questions or difficulties or to better understand how to operate and maintain their heat pump.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Executive Summary | Recommendation #6: Look for opportunities to streamline record keeping/reporting processes to reduce the administrative burden for DAs and contractors, taking into account program tracking and evaluation needs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Executive Summary | Recommendation #7: Update the DA/contractor training guides on the record keeping/reporting processes and use of the software tools to reflect current practices and offer regular training sessions to provide updates on any changes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## APPENDIX XIII

### EPI Tracking Sheet Audit

This appendix presents the results of the EPI tracking sheet audit performed by the Evaluator, which was aimed at:

- › Verifying that all data fields required for the evaluation were included and filled out in the tracking sheet submitted by E1
- › Ensuring that tracked results were accurate by the following:
  - › Verifying that parameters used to calculate program results (gross and net energy and peak demand savings at the generator) were consistent with previous evaluation results
  - › Validating that all calculation steps were performed consistently

Table 1 presents the corrected tracked savings resulting from all changes made by the Evaluator. More details are described further below.

**Table 1: 2024 EPI Corrected Tracked Savings**

| Program Component Results                  | Value Tracked by E1 |      | Corrected Tracked Value |      | Relative Difference |
|--------------------------------------------|---------------------|------|-------------------------|------|---------------------|
|                                            | Value               | Unit | Value                   | Unit | Value               |
| <b>EPI</b>                                 |                     |      |                         |      |                     |
| Gross Energy Savings at the Generator      | 9.515               | GWh  | 9.516                   | GWh  | 0.02%               |
| Gross Peak Demand Savings at the Generator | 1.752               | MW   | 0.879                   | MW   | -49.81%             |
| Net Energy Savings at the Generator        | 9.495               | GWh  | 9.519                   | GWh  | 0.26%               |
| Net Peak Demand Savings at the Generator   | 1.803               | MW   | 0.872                   | MW   | -51.61%             |

The difference between tracked and corrected gross energy savings is explained by the 20% reduction in the unitary savings value for smart thermostats (for MSHPs and electric baseboards) for multifamily dwellings. This reduction had only been applied to unitary savings values as of August 23, 2024, so the Evaluator adjusted the ones before that date for consistency. As for the difference between tracked and corrected net energy savings, this is mainly due to the correction of net-to-gross (NTGR) values.

For both net and gross peak demand savings, there were certain unitary peak demand savings values, notably for humidity sensors, dimmer switches, and solar security fixtures, which were expressed in W and not kW and were therefore 1,000 times too high. Correcting these incorrect values explains the large reduction between the tracked and corrected peak demand savings.

## APPENDIX XIV

### EPI Participant Survey Questionnaire

## EFFICIENT PRODUCT INSTALLATION

### PARTICIPANT SURVEY

Table 1: Overview of Data Collection Activity

| Descriptor                      | This Instrument                                                                                      |
|---------------------------------|------------------------------------------------------------------------------------------------------|
| Instrument Type                 | Participant Survey                                                                                   |
| Estimated Time to Complete      | 15 minutes                                                                                           |
| Target Audience                 | Non-Low-income participants                                                                          |
| Expected Number of Completions  | 100 (40 smart thermostats, 60 DHW measures [30 low-flow showerheads, 15 faucet aerators, 15 others]) |
| Contact List Source             | EfficiencyOne                                                                                        |
| Fielding Firm                   | Narrative Research                                                                                   |
| Estimated Timeline for Fielding | October - November                                                                                   |

## Introduction

Could I speak with [INSERT NAME]?

1. Yes [CONTINUE]
2. No [SAY “PERHAPS YOU CAN HELP ME ANYWAY.” CONTINUE]

Hello, my name is \_\_\_\_\_ and I am with Narrative Research, and we are performing an evaluation of energy efficiency services provided by Efficiency Nova Scotia. Our records indicate that you or your household recently participated in the Efficient Product Installation Service. Are you the person who was most involved with this service?

(IF NEEDED: As part of this service, someone would have come to your house and installed energy-efficient products such as smart thermostats, LED light bulbs and faucet aerators, at no charge, as well as offered advice on ways your house can save energy).

[IF NO, ASK TO SPEAK TO THE APPROPRIATE PERSON]: “May I please speak to the person who knows the most about this service?”]

We would appreciate your help in answering questions related to your participation in this service. The information you provide will be used to help Efficiency Nova Scotia evaluate and improve the service. Is this a good time for you?

(IF NEEDED: You may have recently been contacted by Narrative Research and Efficiency Nova Scotia about your experience with the service. This survey is different as it focuses on other aspects of your participation in the service.)

(IF NEEDED: The survey will take about 12 minutes.)

1. Yes [CONTINUE]
2. No, I don't remember the service / Don't know [PROMPT: “Are you sure? Someone would have come to your house and installed energy-efficient products, at no charge, for you to save energy and money?” RECODE AS “YES” IF THE PROMPT WORKS; IF RESPONDENT STILL SAYS NO: Is there someone else in the household who would know about having participated in this Efficiency Nova Scotia service? [IF YES: ASK TO SPEAK TO THEM AND REPEAT INTRODUCTION]
3. No, but they came to my previous home [CONTINUE]
4. No [THANK, TERMINATE, RECORD, AND KEEP DATA]
99. Refused [THANK, TERMINATE, RECORD, AND KEEP DATA]

[IF REFUSED, ASK “Can we schedule a more convenient time for you to conduct this survey?”]

[SCHEDULED, IF NECESSARY, FOR: \_\_\_\_\_]

## A. Verification

- A1. I am going to read you a list of energy-efficient products that, according to our records, were installed in your home by the Efficient Product Installation Service. For each one, can you please confirm that this product was in fact installed through the service? **[READ WHAT IS ON RECORD (MEASURE#0 IN THE DATABASE)]. [NOTE FOR PROGRAMMER: DO NOT PUT THE NUMBER OF EACH MEASURE]**
- a. LED bulbs
  - b. LED nightlights
  - c. Pipe insulation
  - d. Hot water tank wrap
  - e. Low-flow showerheads or showerwands
  - f. Thermostatic shut-off valve for showers [IF NEEDED: This valve shuts off the water once hot water is flowing. You then have to open the valve to begin showering.]
  - g. Foam gaskets for switch and plug insulation
  - h. Door sweeps
  - i. Window air sealing
  - j. Door weather stripping
  - k. Window film kit
  - l. Bathroom and/or kitchen faucet aerators
  - m. Smart thermostat (IF NECESSARY: Smart thermostats can be controlled by a smartphone, tablet or computer)
  - n. Smart power strip/bar
- 1. Yes, installed through the service
  - 2. No, not installed through the service
  - 98.** Don't know
  - 99.** Refused

**[THANK, TERMINATE, RECORD AND KEEP DATA IF RESPONDENT SAYS "NO", "DK" OR "REFUSED" TO ALL QUESTIONS FROM A1]**

## B. Awareness and Motivations for Participating

B1. How did you first learn about the Efficient Product Installation Service? **[ACCEPT ONE RESPONSE] [DO NOT READ]**

1. TV ads
2. Print ads (magazine or newspaper)
3. Radio ads
4. Through a third-party contractor or service provider (other than Efficiency Nova Scotia)
5. Email
6. Efficiency Nova Scotia website
7. Social media (Facebook, Twitter, Instagram, Google Ads)

## **D. Barriers**

D1. When you initially thought about participating in the Efficient Product Installation Service, what were your concerns, if any?

RECORD VERBATIM: \_\_\_\_\_

**[VOLUNTEERED]**

- 97. No concerns
- 98. Don’t know
- 99. Refused

## **E. Free-Ridership**

**@INSTRUCTION: FREE-RIDERSHIP SERIES SHOULD BE ASKED ONLY TO RESPONDENTS WHO INDICATED:**

**“YES” IN A1A (LED BULBS) – ASK FR LED BULBS SECTION**

**AND/OR**

**“YES” IN A1M (SMART THERMOSTAT) – ASK FR SMART THERMOSTAT SECTION**

**AND/OR**

**“NO” IN A196.99.M (SMART THERMOSTAT) AND “YES” IN EITHER A196.99.C (PIPE INSULATION), A196.99.D (HOT WATER TANK WRAP), A196.99.E (LOW FLOW SHOWERHEADS), A196.99.F (THERMOSTATIC SHUT-OFF VALVE), OR A196.99.L (FAUCET AERATORS) – ASK FR DHW MEASURES SECTION**

**OTHERWISE SKIP TO G SECTION**

## FR - LED BULBS [ASK IF YES IN A1A]

The next questions will be about the LED bulbs that were installed through the service, excluding night lights.

E1. Before learning about the Efficient Product Installation Service, had you already decided to purchase and install LED bulbs in your home? [CODE ONE ONLY]

1. Yes
2. No

**[VOLUNTEERED]**

**98.** Don't know

**99.** Refused

E2. **[IF E1=YES]** Just to confirm: Have I understood correctly that you had already made the decision to purchase and install LED bulbs in your home before you learned about the Efficient Product Installation Service?

1. Yes, correct (already made decision)
2. No, incorrect (not already made decision)

**[VOLUNTEERED]**

**98.** Don't know

**99.** Refused

E3. Without the Efficient Product Installation Service, what is the likelihood you would have paid for the LED bulbs, knowing that the cost is about \$2 to \$4 per bulb?

1. Definitely would have
2. Probably would have
3. Probably would not have
4. Definitely would not have

**[VOLUNTEERED]**

**98.** Don't know

**99.** Refused

**[ASK E4, E5, E6 SEQUENCE IN ORDER/DO NOT RANDOMIZE; REPEAT SCALE IF NECESSARY]**

E4. Without the Efficient Product Installation Service, how likely would you have been to take the initiative to purchase LED bulbs at a store and install them in your home?

1. Definitely would have
2. Probably would have
3. Probably would not have
4. Definitely would not have

**[VOLUNTEERED]**

**98.** Don't know

**99.** Refused

E5. **[IF CODES 1,2,3,4 AT E4]** Without the Efficient Product Installation Service, what is the likelihood you would have postponed replacing your bulbs with LEDs by at least one year?

1. Definitely would have
2. Probably would have
3. Probably would not have
4. Definitely would not have

**[VOLUNTEERED]**

**98.** Don't know

**99.** Refused

E6. **[ASK IF LED BULBS QUANTITY>1 AND CODES 1,2,3,4 AT E4]** Without the Efficient Product Installation Service, which of the following scenarios would have most likely occurred? You would have purchased...

1. ...exactly the same number of LED bulbs
2. ...fewer LED bulbs
3. You would not have purchased or installed LED bulbs

**[VOLUNTEERED]**

**98.** Don't know

**99.** Refused

**[IF ONLY LED BULBS A1A=YES, GO TO E19. OTHERWISE GO TO E7]**

**FR – SMART THERMOSTAT [ASK IF YES IN A196.99.M]**

The next questions will be about the smart thermostat you had installed through the service.

E7. Before learning about the Efficient Product Installation Service, had you already decided to purchase and install smart thermostats in your home? **[CODE ONE ONLY]**

1. Yes
2. No

**[VOLUNTEERED]**

**98.** Don't know

**99.** Refused

E8. **[IF E7=YES]** Just to confirm: Have I understood correctly that you had already made the decision to purchase and install smart thermostats in your home before you learned about the Efficient Product Installation Service?

1. Yes, correct (already made decision)
2. No, incorrect (not already made decision)

**[VOLUNTEERED]**

**98.** Don't know

**99.** Refused

E9. Without the Efficient Product Installation Service, what is the likelihood you would have paid for the smart thermostat, knowing that the cost is about \$140 per thermostat?

1. Definitely would have
2. Probably would have
3. Probably would not have
4. Definitely would not have

**[VOLUNTEERED]**

**98.** Don't know

**99.** Refused

**[ASK E10, E11, E12 SEQUENCE IN ORDER/DO NOT RANDOMIZE]**

E10. Without the Efficient Product Installation Service, how likely would have been to take the initiative to purchase smart thermostats at a store and install them in your home?

1. Definitely would have
2. Probably would have
3. Probably would not have
4. Definitely would not have

**[VOLUNTEERED]**

**98.** Don't know

**99.** Refused

E11. **[IF CODES 1,2,3,4 AT E10]** Without the Efficient Product Installation Service, what is the likelihood you would have postponed replacing your old thermostats with smart thermostats by at least one year?

1. Definitely would have
2. Probably would have
3. Probably would not have
4. Definitely would not have

**[VOLUNTEERED]**

**98.** Don't know

**99.** Refused

E12. **[ASK IF SMART THERMOSTAT QUANTITY>1 AND IF CODES 1,2,3,4 AT E10]** Without the Efficient Product Installation Service, which of the following scenarios would have most likely occurred? You would have purchased and installed...

1. ...exactly the same number of smart thermostats
2. ...fewer smart thermostats
3. You would not have purchased or installed any smart thermostats

**[VOLUNTEERED]**

**98.** Don't know

**99.** Refused

**FR – DOMESTIC HOT WATER MEASURES [ASK IF NO IN A1M AND IF YES IN A196.99.C, A196.99.D, A196.99.E, A196.99.F, OR A196.99.L, OTHERWISE GO TO E19]**

The next questions will be about the **<DHW MEASURE>** that you had installed through the service.

E13. Before learning about the Efficient Product Installation Service, had you already decided to purchase and install **<DHW MEASURE>** in your home?

1. Yes
2. No

**[VOLUNTEERED]**

**98.** Don't know

**99.** Refused

E14. **[IF E13=YES]** Just to confirm: Have I understood correctly that you had already made the decision to purchase and install **<DHW MEASURE>** in your home before you learned about the Efficient Product Installation Service?

1. Yes, correct (already made decision)
2. No, incorrect (not already made decision)

**[VOLUNTEERED]**

**98.** Don't know

**99.** Refused

E15. Without the Efficient Product Installation Service, what is the likelihood you would have paid for the **<DHW MEASURE>** knowing that the cost is about...

A1C. Pipe insulation: \$2 per foot

A1D. Hot water tank wrap: \$50

A1E. Low-flow showerheads or showerwands: \$50

A1F. Thermostatic shut-off valve for showers: \$50

A1L. Bathroom and/or kitchen faucet aerators: \$8-\$10

1. Definitely would have
2. Probably would have
3. Probably would not have
4. Definitely would not have

**[VOLUNTEERED]**

**98.** Don't know

**99.** Refused

**[ASK E16, E17, E18 SEQUENCE IN ORDER/DO NOT RANDOMIZE]**

E16. Without the efficient product installation service, how likely would you have been to take the initiative to purchase **<DHW MEASURE>** at a store and install them in your home?

1. Definitely would have
2. Probably would have
3. Probably would not have
4. Definitely would not have

**[VOLUNTEERED]**

**98.** Don't know

**99.** Refused

E17. **[IF CODES 1,2,3,4 AT E16]** Without the Efficient Product Installation Service, what is the likelihood you would have postponed replacing your **<DHW MEASURE>** by at least one year?

1. Definitely would have
2. Probably would have
3. Probably would not have
4. Definitely would not have

**[VOLUNTEERED]**

**98.** Don't know

**99.** Refused

E18. [ASK IF <DHW MEASURE> QUANTITY>1 AND IF CODES 1,2,3,4 AT E16] Without the Efficient Product Installation Service, which of the following scenarios would have most likely occurred? You would have purchased and installed...

1. ...exactly the same number of <DHW MEASURE>
2. ...fewer <DHW MEASURE>
3. You would not have purchased or installed any <DHW MEASURE>

[VOLUNTEERED]

98. Don't know

99. Refused

[ASK E19 ONCE AT THE END OF SECTION E FOR EVERYONE, WHATEVER THEIR MEASURE, NOT FOR EACH PRODUCT]

E19. How influential were the following two factors in your decision to have energy-efficient products installed in your home? [RANDOMIZE]

| Factor (READ AND RANDOMIZE)                                                       | Responses                                                                                                                         |

## F. Cross-Influence

INSTRUCTION: CROSS-INFLUENCE SERIES SHOULD BE ASKED ONLY TO RESPONDENTS WHO INDICATED

“YES” IN A1A (LED BULBS) AND/OR “YES” IN A196.99.M (SMART THERMOSTAT) AND/OR “YES” IN EITHER A196.99.C (PIPE INSULATION), A196.99.D (HOT WATER TANK WRAP), A196.99.E (LOW FLOW SHOWERHEADS), A196.99.F (THERMOSTATIC SHUT-OFF VALVE), OR A196.99.L (FAUCET AERATORS)

OTHERWISE SKIP TO G SERIES.

READ AND ROTATE (F1 + F2 - F4) AND (F5 + F6 - F8) SEQUENCES

F1. Before participating in the efficient product installation service in <MONTH/YEAR>, had you at any time in the past participated in any efficiency nova scotia program or service?

1. Yes
2. No

**[VOLUNTEERED]**

- 98.** Don't know  
**99.** Refused

For the following three statements, please indicate whether you agree or disagree.

F2. **[IF F1=1]** Do you agree or disagree that your previous participation in an Efficiency Nova Scotia program or service was a major factor in your decision to have energy-efficient products installed in your home?

1. Agree
2. Disagree

**[VOLUNTEERED]**

- 98.** Don't know  
**99.** Refused

F3. **[IF F1=1]** Do you agree or disagree that because of your previous participation in an Efficiency Nova Scotia program or service and what you learned by participating in the service, you requested the installation of energy-efficient products at no cost in your home?

1. Agree
2. Disagree

**[VOLUNTEERED]**

- 98.** Don't know  
**99.** Refused

F4. **[IF F1=1]** Do you agree or disagree that because of your previous participation in another Efficiency Nova Scotia program or service and what you learned by participating, you took into account the savings on your energy bill when evaluating different energy-efficient products for your home?

1. Agree
2. Disagree

**[VOLUNTEERED]**

- 98.** Don't know  
**99.** Refused

F5. Before participating in the Efficient Product Installation Service in <MONTH/YEAR>, had you at any time in the past seen Efficiency Nova Scotia advertisements or information discussing the benefits of energy efficiency?

1. Yes
2. No

**[VOLUNTEERED]**

- 98.** Don't know
- 99.** Refused

For the following three statements, please indicate whether you agree or disagree.

F6. **[IF F5=1]** Do you agree or disagree that the promotion of energy efficiency by Efficiency Nova Scotia was a major factor in your decision to have energy-efficient products installed in your home?

1. Agree
2. Disagree

**[VOLUNTEERED]**

- 98.** Don't know
- 99.** Refused

F7. **[IF F5=1]** Do you agree or disagree that the promotion of energy efficiency by Efficiency Nova Scotia prompted you to ask for the installation of energy-efficient products at no cost in your home?

1. Agree
2. Disagree

**[VOLUNTEERED]**

- 98.** Don't know
- 99.** Refused

F8. **[IF F5=1]** Do you agree or disagree that you took into account the savings on your energy bill when evaluating different energy-efficient products for your home due to the promotion of energy efficiency by Efficiency Nova Scotia?

1. Agree
2. Disagree

**[VOLUNTEERED]**

- 98.** Don't know
- 99.** Refused

## G. Spillover

G1. **[ASK ALL]** Since participating in the Efficient Product Installation Service, have you installed any additional energy-efficient products in your home?

1. Yes
2. No **[GO TO G5]**

**[VOLUNTEERED]**

**98.** Don't know/Don't recall **[GO TO G5]**

**99.** Refused **[GO TO G5]**

G2. **[IF G1=YES]** What energy-efficient products have you installed in your home since participating in the Efficient Product Installation Service? **[DO NOT READ, ALLOW MULTIPLE KEEPING CODE 97 AND 98 EXCLUSIVE]** Probe: Any others?

1. LED bulbs
2. LED fixtures
3. Low flow showerheads
4. Smart power strip/smart power bar
5. ENERGY STAR refrigerator
6. ENERGY STAR clothes washer
7. NEST or smart thermostats
8. Programmable thermostats
9. Dehumidifiers
10. Air purifiers
11. Clothesline
12. Variable speed pool pumps
13. Heat pump water heaters
14. Faucet aerators
15. Pipe insulation
16. Tank wrap
17. Thermostatic shut-off valves
18. Door sweeps
19. Window air sealing kits
20. Door weather stripping kits
96. Other: Please specify: \_\_\_\_\_
- 97.** None **[GO TO G5]**
- 98.** Don't know **[GO TO G5]**

G3. **[IF ANY OF CODE 1-20 AND/OR 96 IN G2; ASK FOR EACH RESPONSE IN G2]** How many **[INSERT ANSWER FROM G2]** **[FOR STATEMENT L (CODE 15 IN G2):** feet of pipe insulation] did you purchase and install?

- a. LED bulbs
- b. LED fixtures
- c. Low flow showerheads
- d. Smart power strip/smart power bar
- e. NEST or smart thermostats
- f. Programmable thermostats
- g. Dehumidifiers
- h. Air purifiers
- i. Clothesline
- j. Faucet aerators
- k. Pipe insulation
- l. Thermostatic shut-off valves
- m. Door sweeps
- n. Window air sealing kits
- o. Door weather stripping kits
- p. Other

RECORD NUMBER IN QUANTITY OR NUMBER OF FEET OF PIPE INSULATION

**[VOLUNTEERED]**

**98.** Don't know

**99.** Refused

G4. **[IF ANY OF G3A-H > 0; SHOW ONLY PRODUCTS FROM G3 IF > 0]** Did you receive an instant rebate at the cashier for the **[INSERT PRODUCT FROM G2 IF G2 > 0]** you purchased?

- 1. Yes
- 2. No

**[VOLUNTEERED]**

**98.** Don't know

**99.** Refused

G5. **[ASK IF ANY OF G3A-O > 0]** How influential was your experience with the Efficient Product Installation Service in your decision to install these additional energy-efficient products?

1. Extremely influential
2. Influential
3. Not very influential
4. Not at all influential

**[VOLUNTEERED]**

98. Don't know
99. Refused

## H. Recommendations for Program Improvements

H1. Do you have any recommendations to help improve the Efficient Product Installation Service?  
**PROBE:** Anything else? **[DO NOT READ, RECORD VERBATIM]**

RECORD VERBATIM: \_\_\_\_\_

97. None
98. Don't know
99. Refused

## I. Demographics

**[ASK ALL]** These final questions are asked for statistical purposes only. The information collected is strictly confidential.

I1. What type of residence do you live in? **[READ RESPONSES 1-7, THEN 8; SELECT ONE RESPONSE]**

1. Apartment building that has fewer than five stories
2. Apartment building that has five or more stories
3. Row house (Single story apartment building)
4. Detached single-family home
5. Semi-detached house
6. Mobile home or house trailer
7. Townhouse or duplex with shared adjacent walls
8. Or some other type **[SPECIFY: \_\_\_\_\_]**

**[VOLUNTEERED]**

98. Don't know
99. Refused
